# BUBBLE TOWER SOLUTIONS FOR SUPERCRITICAL ELLIPTIC PROBLEM IN $\mathbb{R}^{N}$ 

WENJING CHEN, JUAN DÁVILA, AND IGNACIO GUERRA

Abstract. We consider the following problem

$$
\left\{\begin{array}{l}
-\Delta u+u=u^{p}+\lambda u^{q}, \quad u>0 \quad \text { in } \mathbb{R}^{N} \\
u(z) \rightarrow 0 \text { as } \quad|z| \rightarrow \infty
\end{array}\right.
$$

where $p=p^{*}+\varepsilon$, with $p^{*}=\frac{N+2}{N-2}, 1<q<\frac{N+2}{N-2}$ if $N \geq 4,3<q<5$ if $N=3$, $\lambda>0$, and $\varepsilon$ is a positive parameter. We prove that for $\varepsilon>0$ small enough, it has a solution with the shape of a tower of bubbles.

Keywords: elliptic equation, non-uniqueness, bubble-tower solutions

## 1. Introduction

We are interested in the elliptic equation

$$
\left\{\begin{array}{c}
-\Delta u+u=u^{p}+\lambda u^{q}, \quad u>0 \quad \text { in } \mathbb{R}^{N},  \tag{1.1}\\
u(x) \rightarrow 0 \text { as }|x| \rightarrow \infty
\end{array}\right.
$$

where $N \geq 3, \lambda>0$ and $1<q<p$. This problem arises in the study of standing waves of a nonlinear Schrödinger equation with two power type nonlinearities, see for example Tao, Visan and Zhang [28].

If $p=q$, equation (1.1) reduces to

$$
\left\{\begin{array}{l}
-\Delta u+u=u^{p}, \quad u>0 \quad \text { in } \mathbb{R}^{N}  \tag{1.2}\\
u(x) \rightarrow 0 \quad \text { as }|x| \rightarrow \infty
\end{array}\right.
$$

after a suitable scaling.
Thanks to the classical result of Gidas, Ni and Nirenberg [15], solutions of (1.1) and (1.2) are radially symmetric about some point, which we will assume is always the origin.

It is well known that problem (1.2) has a solution if and only if $1<p<\frac{N+2}{N-2}$. Existence was proved by Berestycki and Lions [2], while non-existence follows from the Pohozaev identity [26]. Uniqueness also holds and was fully settled by Kwong [16], after a series of contributions [4, 17, 23, 24, 22, 21]. See also Felmer, Quaas, Tang and Yu [10] for further properties.

Concerning (1.1), the work of Berestycki and Lions [2] is still applicable if $1<$ $q<p<\frac{N+2}{N-2}$, and one obtains existence of a solution. If $p, q \geq \frac{N+2}{N-2}$ there is no solution, again from the Pohozaev identity.

Recently, Dávila, del Pino and Guerra [5] proved that uniqueness does not hold in general for (1.1), if $1<q<p<\frac{N+2}{N-2}$. More precisely if $N=3$, the authors
obtained at least three solutions to problem (1.1) if $1<q<3, \lambda>0$ is sufficiently large and fixed, and $p<5$ is close enough to 5 .

Let us mention some contributions to the question of existence for (1.1) when one exponent is subcritical and other is critical or supercritical. If $1<q<p=\frac{N+2}{N-2}$ in (1.1), Alves, de Morais Filho and Souto [1] proved:

- when $N \geq 4$, there exists a nontrivial classical solution for all $\lambda>0$ and $1<q<\frac{\bar{N}+2}{N-2}$;
- when $N=3$, there exists a nontrivial classical solution for all $\lambda>0$ and $3<q<5$;
- when $N=3$, there exists a nontrivial classical solution for $\lambda>0$ large enough and $1<q \leq 3$.
Moreover, Ferrero and Gazzola [11] proved that for $q<\frac{N+2}{N-2} \leq p$, there exists $\bar{\lambda}>0$, such that if $\lambda>\bar{\lambda}$, then (1.1) has at least one solution, while for $q<\frac{N+2}{N-2}<p$, there exists $0<\underline{\lambda}<\bar{\lambda}$ such that if $\lambda<\underline{\lambda}$, then there is no solution.

In this paper, we are interested in multiplicity of solutions of (1.1), and for this we take an asymptotic approach, that is, we consider

$$
\left\{\begin{array}{l}
-\Delta u+u=u^{p}+\lambda u^{q}, \quad u>0 \quad \text { in } \mathbb{R}^{N}  \tag{1.3}\\
u(z) \rightarrow 0 \text { as } \quad|z| \rightarrow \infty
\end{array}\right.
$$

where $p=p^{*}+\varepsilon$, with $p^{*}=\frac{N+2}{N-2}, \lambda>0$ and $\varepsilon>0$ are parameters, and $q$ satisfies

$$
\begin{equation*}
1<q<\frac{N+2}{N-2} \quad \text { if } N \geq 4 ; \quad 3<q<5 \text { if } N=3 \tag{1.4}
\end{equation*}
$$

Our result can be stated as follows.
Theorem 1.1. Let $\lambda>0$ and let $q$ satisfy (1.4). Given an integer $k \geq 1$, then there exists $\varepsilon_{0}>0$ such that for any $\varepsilon \in\left(0, \varepsilon_{0}\right)$, there is a solution $u_{\varepsilon}(z)$ of problem (1.3) of the form

$$
\begin{equation*}
u_{\varepsilon}(z)=(N(N-2))^{\frac{N-2}{4}} \sum_{j=1}^{k} \frac{\varepsilon^{-\left[(j-1)+\frac{1}{p^{*}-q}\right]}\left(\Lambda_{j}^{*}\right)^{-\frac{N-2}{2}}}{\left(1+\varepsilon^{-\frac{4}{N-2}\left[(j-1)+\frac{1}{p^{*}-q}\right]}\left(\Lambda_{j}^{*}\right)^{-2}|z|^{2}\right)^{\frac{N-2}{2}}}(1+o(1)), \tag{1.5}
\end{equation*}
$$

where the constants $\Lambda_{j}^{*}>0, j=1,2, \ldots, k$, can be computed explicitly and depend on $k, N, q$.

The expansion (1.5) is valid if $\frac{1}{C} \varepsilon^{\frac{2}{N-2}\left[(i-1)+\frac{1}{p^{*}-q}\right]} \leq|z| \leq C \varepsilon^{\frac{2}{N-2}\left[(i-1)+\frac{1}{p^{*}-q}\right]}$, with some $i \in\{1,2, \cdots, k\}$, and $o(1) \rightarrow 0$ uniformly as $\varepsilon \rightarrow 0$ in this region.

The solutions described in this result behave like a superposition of "bubbles" of different blow-up orders centered at the origin, and hence have been called bubbletower solutions. By bubbles we mean the functions

$$
\begin{equation*}
w_{\mu}(z)=\alpha_{N} \frac{\mu^{\frac{N-2}{2}}}{\left(\mu^{2}+|z|^{2}\right)^{\frac{N-2}{2}}}, \quad \text { with } \quad \alpha_{N}=(N(N-2))^{\frac{N-2}{4}} \tag{1.6}
\end{equation*}
$$

where $\mu>0$, which are the unique positive solutions of

$$
-\Delta w=w^{p^{*}} \quad \text { in } \mathbb{R}^{N}
$$

(except translations).

Figure 1. Left: $u(0)$ vs. $p$ for $\lambda$ large and fixed. Right: $u(0)$ vs. $\lambda$ for $p=p^{*}+\varepsilon, \varepsilon>0$ small and fixed.

Based on numerical simulations we present bifurcation diagrams for solutions of (1.3) where $q$ satisfies (1.4). In Figure 1 (left) we show the bifurcation diagram as a function of $p$ for a fixed large $\lambda$, and in Figure 1 (right) we show the diagram as a function of $\lambda$ for $p=p^{*}+\varepsilon, \varepsilon>0$ small and fixed. In both diagrams we observe branches of solutions, with the upper part having unbounded solutions as $\varepsilon \rightarrow 0$ or $\lambda \rightarrow \infty$. We believe that the solutions constructed in Theorem 1.1 are located on these upper branches, and are shown in the diagrams for the cases of 1 and 2 bubbles.

Bubble-tower solutions were found by del Pino, Dolbeault and Musso [6] for a slightly supercritical Brezis-Nirenberg problem in a ball, and after that have been studied intensively $[3,7,8,9,13,14,18,19,20,25]$. In particular we mention the work of Campos [3] who considered the existence of bubble-tower solutions to a problem related to ours:

$$
\left\{\begin{array}{l}
-\Delta u=u^{p^{*} \pm \varepsilon}+u^{q}, \quad u>0 \quad \text { in } \mathbb{R}^{N} \\
u(z) \rightarrow 0 \text { as } \quad|z| \rightarrow \infty
\end{array}\right.
$$

with $\frac{N}{N-2}<q<p^{*}=\frac{N+2}{N-2}, N \geq 3$.
For the proof we consider a variation of the so-called Emden-Fowler transformation:

$$
v(x)=\left(\frac{p^{*}-1}{2}\right)^{\frac{2}{p^{*}-1}} r^{\frac{2}{p^{*}-1}} u(r)
$$

with

$$
r=|z|=e^{-\frac{p^{*}-1}{2} x}, \quad x \in(-\infty,+\infty)
$$

Then finding a radial solution $u(r)$ to (1.3) corresponds to solving the problem

$$
\left\{\begin{array}{l}
\mathcal{L}_{0}(v)=\alpha_{\varepsilon} e^{\varepsilon x} v^{p^{*}+\varepsilon}+\lambda \beta_{N} e^{-\left(p^{*}-q\right) x} v^{q} \quad \text { in }(-\infty,+\infty)  \tag{1.7}\\
v(x)>0 \quad \text { for } \quad x \in(-\infty,+\infty) \\
v(x) \rightarrow 0 \quad \text { as } \quad|x| \rightarrow \infty
\end{array}\right.
$$

where

$$
\begin{equation*}
\mathcal{L}_{0}(v)=-v^{\prime \prime}+v+\left(\frac{2}{N-2}\right)^{2} e^{-\frac{4}{N-2} x} v \tag{1.8}
\end{equation*}
$$

is the transformed operator associated to $-\Delta+I d$, and $\alpha_{\varepsilon}, \beta_{N}$ are constants.
Under the Emden-Fowler transformation the bubbles $w_{\mu}$ take the form

$$
\begin{equation*}
W(x-\xi)=\left(\frac{4 N}{N-2}\right)^{\frac{N-2}{4}} e^{-(x-\xi)}\left(1+e^{-\frac{4}{N-2}(x-\xi)}\right)^{-\frac{N-2}{2}} \tag{1.9}
\end{equation*}
$$

with $\mu=e^{-\frac{2}{N-2} \xi}$, and solve

$$
\left\{\begin{array}{l}
W^{\prime \prime}-W+W^{p^{*}}=0, \quad \text { in }(-\infty,+\infty) \\
W^{\prime}(0)=0 \\
W(x)>0, \quad W(x) \rightarrow 0 \quad \text { as } \quad|x| \rightarrow \infty
\end{array}\right.
$$

In Section 2, we build an approximate solution to (1.7) as a sum of suitable projections of the transformed bubbles $W$ centered at $0<\xi_{1}<\ldots<\xi_{k}$ with $\xi_{1} \rightarrow$ $\infty$. After the study of the linearized problem at the approximate solution in Section 3 , and solvability of a nonlinear projected problem in Section 4, we perform a Lyapunov-Schmidt reduction procedure as in $[12,18,3]$. Then the problem becomes to find a critical point of some functional depending on $0<\xi_{1}<\ldots<\xi_{k}$. This is done in Section 5 where Theorem 1.1 is proved.

From the technical point of view, one difficulty is due to the form of the linearized operator. As $r \rightarrow \infty$ dominates $-\Delta+I$ (or $\mathcal{L}_{0}$ as $x \rightarrow-\infty$ after the change of variables) while near the regions of concentration the important part of the linearization is $\Delta+p^{*} w_{\mu}^{p^{*}-1}$. This is taken into account in the norm we use for the solutions of linearized problem, and it is more naturally written for the functions after the Lane-Emden transformation. This is different from may previous works, but is already contained in [5].

## 2. The first approximate solution

In this section, we build the first approximate solution to (1.3). In order to do this, we introduce $U_{\mu}$ as the unique solution of the following problem

$$
\left\{\begin{array}{l}
-\Delta U_{\mu}+U_{\mu}=w_{\mu}^{p^{*}} \quad \text { in } \mathbb{R}^{N}  \tag{2.1}\\
U_{\mu}(z) \rightarrow 0 \text { as } \quad|z| \rightarrow \infty
\end{array}\right.
$$

where $w_{\mu}$ are the bubbles (1.6). We write

$$
U_{\mu}(z)=w_{\mu}(z)+R_{\mu}(z)
$$

Then $R_{\mu}(z)$ satisfies

$$
-\Delta R_{\mu}(z)+R_{\mu}(z)=-w_{\mu}(z) \quad \text { in } \mathbb{R}^{N}, \quad R_{\mu}(z) \rightarrow 0 \quad \text { as } \quad|z| \rightarrow \infty
$$

We have the following result, whose proof is postponed to the Appendix.
Lemma 2.1. Assume $0<\mu \leq 1$, we have
(a) $0<U_{\mu}(z) \leq w_{\mu}(z)$, for $z \in \mathbb{R}^{N}$.
(b) One has

$$
U_{\mu}(z) \leq C \mu^{\frac{N-2}{2}}|z|^{-(N+2)}, \quad \text { for } \quad|z| \geq R
$$

where $R$ is a large positive number but fixed.
(c) Given any $\mu>0$ small, we have

$$
\begin{gather*}
\left|R_{\mu}(z)\right| \leq C \frac{\mu^{\frac{N-2}{2}}}{|z|^{N-2}} \quad \text { for } \quad N \geq 3, \quad|z| \geq 1  \tag{2.2}\\
\left|R_{\mu}(z)\right| \leq C\left\{\begin{array}{ll}
\mu^{-\frac{N-6}{2}} & \text { for } N \geq 5 ; \\
\mu \log \frac{1}{\mu} & \text { for } N=4 ; \\
\mu^{\frac{1}{2}} & \text { for } N=3
\end{array} \quad|z| \leq \frac{\mu}{2}\right.  \tag{2.3}\\
\left|R_{\mu}(z)\right| \leq C\left\{\begin{array}{ll}
\mu^{-\frac{N-6}{2}} \frac{1}{\left(1+\left|\frac{z}{\mu}\right|^{2}\right)^{\frac{N-4}{2}}} & \text { for } N \geq 5 ; \\
\mu \log \frac{1}{|z|} & \text { for } N=4 ; \\
\mu^{\frac{1}{2}} & \text { for } N=3
\end{array} \quad \frac{\mu}{2} \leq|z| \leq 1\right. \tag{2.4}
\end{gather*}
$$

We define the following Emden-Fowler transformation

$$
v(x)=\mathcal{T}(u(r))=\left(\frac{p^{*}-1}{2}\right)^{\frac{2}{p^{*}-1}} r^{\frac{2}{p^{*}-1}} u(r), \quad r=|z|=e^{-\frac{p^{*}-1}{2} x}
$$

with $x \in(-\infty,+\infty)$. Using this transformation, finding a radial solution $u(r)$ to problem (1.3) corresponds to that of solving the problem (1.7). where

$$
\alpha_{\varepsilon}=\left(\frac{p^{*}-1}{2}\right)^{-\frac{2 \varepsilon}{p^{*}-1}}, \quad \beta_{N}=\left(\frac{p^{*}-1}{2}\right)^{\frac{2\left(p^{*}-q\right)}{p^{*}-1}}
$$

We observe that $\mathcal{L}_{0}$ is the transformed operator associated to $-\Delta+I d$.
Define

$$
V_{\xi}(x)=\mathcal{T}\left(U_{\mu}\right)(r), \quad \text { with } r=e^{-\frac{p^{*}-1}{2} x}, \quad \mu=e^{-\frac{2}{N-2} \xi}
$$

Then $V_{\xi}(x)$ is the solution of the problem

$$
\left\{\begin{array}{l}
\mathcal{L}_{0} V_{\xi}(x)=W(x-\xi)^{p^{*}} \quad \text { in }(-\infty,+\infty) \\
V_{\xi}(x) \rightarrow 0 \text { as } \quad|x| \rightarrow \infty
\end{array}\right.
$$

We write

$$
V_{\xi}(x)=W(x-\xi)+R_{\xi}(x),
$$

where $W$ is given in (1.9) and $R_{\xi}(x)=\mathcal{T}\left(R_{\mu}\right)(r)$. By the Emden-Fowler transformation and as a consequence of Lemma 2.1, we have the following estimates.

Lemma 2.2. For $\xi>0$, we have
(a) $0<V_{\xi}(x) \leq W(x-\xi)=O\left(e^{-|x-\xi|}\right), \quad$ for $x \in \mathbb{R}$.
(b)

$$
\begin{equation*}
V_{\xi}(x) \leq C e^{\frac{N+6}{N-2} x} e^{-\xi}, \quad \text { for } \quad-\infty<x \leq-\frac{N-2}{2} \log R \tag{2.5}
\end{equation*}
$$

for $R>0$ is a fixed large number as Lemma 2.1.
(c) For $N \geq 3$, there is a positive constant $C$, such that

$$
\left|R_{\xi}(x)\right| \leq C \begin{cases}e^{-|x-\xi|} & \text { if } \quad x \leq 0 \\ e^{-|x-\xi|} e^{-\frac{2}{N-2} \min \{x, \xi\}} & \text { if } \quad x \geq 0\end{cases}
$$

Define

$$
Z_{\xi}(x):=\partial_{\xi} V_{\xi}(x)=\partial_{\xi} W(x-\xi)+\partial_{\xi} R_{\xi}(x) .
$$

Note that $\partial_{\xi} W(x-\xi)=O\left(e^{-|x-\xi|}\right)$ and

$$
\begin{gather*}
\partial_{\xi} W(x-\xi)=-\frac{2}{N-2} \mu \mathcal{T}\left(\partial_{\mu} w_{\mu}(r)\right) \\
Z_{\xi}(x)=-\frac{2}{N-2} \mu \mathcal{T}\left(\widetilde{Z}_{\mu}(r)\right) \quad \text { with } \quad \widetilde{Z}_{\mu}(z)=\partial_{\mu} U_{\mu}(z)  \tag{2.6}\\
\partial_{\xi} R_{\xi}(x)=-\frac{2}{N-2} \mu \mathcal{T}\left(\partial_{\mu} R_{\mu}(r)\right) . \tag{2.7}
\end{gather*}
$$

Then from (6.1), (2.7) and Lemma 2.2 (c), we have for $N \geq 3$,

$$
\left|\partial_{\xi} R_{\xi}(x)\right| \leq C \begin{cases}e^{-|x-\xi|} & \text { if } \quad x \leq 0 \\ e^{-|x-\xi|} e^{-\frac{2}{N-2} \min \{x, \xi\}} & \text { if } \quad x \geq 0\end{cases}
$$

Therefore

$$
Z_{\xi}(x)=O\left(e^{-|x-\xi|}\right) \quad \text { for } \forall x \in \mathbb{R}
$$

Moreover, from (6.2) and (2.6), we find

$$
\left|Z_{\xi}(x)\right| \leq C e^{\frac{N+6}{N-2} x} e^{-\xi}, \quad \text { for } \quad-\infty<x \leq-\frac{N-2}{2} \log R
$$

for a fixed large $R>0$.
Let $\eta>0$ be a small but fixed number. Given an integer number $k$, let $\Lambda_{j}$, for $j=1, \cdots, k$, be positive numbers and satisfy

$$
\begin{equation*}
\eta<\Lambda_{j}<\frac{1}{\eta} \tag{2.8}
\end{equation*}
$$

Set

$$
\begin{equation*}
\mu_{1}=\varepsilon^{\frac{2}{(N+2)-(N-2) q}} \Lambda_{1} \quad \text { and } \quad \mu_{j}=\varepsilon^{\frac{2}{N-2}(j-1)+\frac{2}{(N+2)-(N-2) q}} \Lambda_{j} \tag{2.9}
\end{equation*}
$$

for $j=2, \cdots, k$. We observe that

$$
\frac{\mu_{j+1}}{\mu_{j}}=\varepsilon^{\frac{2}{N-2}} \frac{\Lambda_{j+1}}{\Lambda_{j}}, \quad j=1, \cdots, k-1
$$

Define $k$ points in $\mathbb{R}$ as

$$
\mu_{j}=e^{-\frac{2}{N-2} \xi_{j}}, \quad j=1, \cdots, k
$$

Then we have that

$$
0<\xi_{1}<\xi_{2}<\cdots<\xi_{k}
$$

and

$$
\left\{\begin{array}{l}
\xi_{1}=-\frac{1}{p^{*}-q} \log \varepsilon-\frac{N-2}{2} \log \Lambda_{1}  \tag{2.10}\\
\xi_{j}-\xi_{j-1}=-\log \varepsilon-\frac{N-2}{2} \log \frac{\Lambda_{j}}{\Lambda_{j-1}}, \quad j=2, \cdots, k
\end{array}\right.
$$

Set

$$
\begin{equation*}
W_{j}=W\left(x-\xi_{j}\right), \quad R_{j}=R_{\xi_{j}}(x), \quad V_{j}=W_{j}+R_{j}, \quad V=\sum_{j=1}^{k} V_{j} \tag{2.11}
\end{equation*}
$$

We look for a solution of (1.3) of the form $u=\sum_{j=1}^{k} U_{\mu_{j}}+\psi$ corresponds to find a solution of (1.7) of the form $v=V+\phi$, where $V$ is given by (2.11) and $\phi=\mathcal{T}(\psi)$ is a small term. Thus problem (1.7) becomes

$$
\left\{\begin{array}{l}
\mathcal{L}_{\varepsilon}(\phi)=N(\phi)+E \quad \text { in }(-\infty,+\infty)  \tag{2.12}\\
\phi(x)>0 \quad \text { for } \quad x \in(-\infty,+\infty) \\
\phi(x) \rightarrow 0 \quad \text { as } \quad|x| \rightarrow \infty
\end{array}\right.
$$

where

$$
\begin{aligned}
\mathcal{L}_{\varepsilon}(\phi)=\mathcal{L}_{0}(\phi) & -\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) e^{\varepsilon x} V^{p^{*}+\varepsilon-1} \phi-\lambda q \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q-1} \phi \\
N(\phi)= & \alpha_{\varepsilon} e^{\varepsilon x}\left[(V+\phi)^{p^{*}+\varepsilon}-V^{p^{*}+\varepsilon}-\left(p^{*}+\varepsilon\right) V^{p^{*}+\varepsilon-1} \phi\right] \\
& +\lambda \beta_{N} e^{-\left(p^{*}-q\right) x}\left[(V+\phi)^{q}-V^{q}-q V^{q-1} \phi\right]
\end{aligned}
$$

and

$$
\begin{aligned}
E & =\alpha_{\varepsilon} e^{\varepsilon x} V^{p^{*}+\varepsilon}-\mathcal{L}_{0}(V)+\lambda \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q} \\
& =\alpha_{\varepsilon} e^{\varepsilon x} V^{p^{*}+\varepsilon}-\sum_{j=1}^{k} W_{j}^{p^{*}}+\lambda \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q}
\end{aligned}
$$

where $\mathcal{L}_{0}$ is defined by (1.8).

## 3. The linear problem

In order to solve problem (2.12), we consider first the following problem: given points $\xi=\left(\xi_{1}, \cdots, \xi_{k}\right)$, finding a function $\phi$ such that for certain constants $c_{1}, c_{2}, \cdots, c_{k}$,

$$
\left\{\begin{array}{l}
\mathcal{L}_{\varepsilon}(\phi)=N(\phi)+E+\sum_{j=1}^{k} c_{j} Z_{j} \quad \text { in }(-\infty,+\infty)  \tag{3.1}\\
\lim _{|x| \rightarrow \infty} \phi(x)=0 \\
\int_{\mathbb{R}} Z_{j} \phi=0, \quad \forall j=1, \cdots, k
\end{array}\right.
$$

where $Z_{j}(x)=Z_{\xi_{j}}(x)=\partial_{\xi_{j}} V_{\xi_{j}}(x)$ for $j=1,2, \cdots, k$.
To solve (3.1), it is important to understand its linear part, thus we consider the following problem: given a function $h$, finding $\phi$ such that

$$
\left\{\begin{array}{l}
\mathcal{L}_{\varepsilon}(\phi)=h+\sum_{j=1}^{k} c_{j} Z_{j} \quad \text { in }(-\infty,+\infty)  \tag{3.2}\\
\lim _{|x| \rightarrow \infty} \phi(x)=0 \\
\int_{\mathbb{R}} Z_{j} \phi=0, \quad \forall j=1, \cdots, k
\end{array}\right.
$$

for certain constants $c_{j}$.
Now we analyze invertibility properties of the operator $\mathcal{L}_{\varepsilon}$ under the orthogonality conditions. Let $\sigma$ satisfy

$$
\begin{equation*}
0<\sigma<\min \left\{q-1,1, \frac{(N+2)(2 q-1)}{N+6}, \frac{3 q-p^{*}}{2}\right\} \tag{3.3}
\end{equation*}
$$

We define the real number $M$ as follows

$$
M= \begin{cases}0, & \text { if } 1 \geq \frac{4}{N-2}+\sigma  \tag{3.4}\\ \max \{0, \gamma\}, & \text { if } 1 \leq \frac{4}{N-2}+\sigma\end{cases}
$$

where $\gamma$ satisfies

$$
\left(1-\left(\frac{4}{N-2}+\sigma\right)^{2}\right) e^{-\frac{4}{N-2} \gamma}=-\frac{1}{2}\left(\frac{2}{N-2}\right)^{2}
$$

We define the following norms for functions $\phi, h$ defined on $\mathbb{R}$,

$$
\begin{equation*}
\|\phi\|_{*}=\sup _{x \leq-M} e^{-\left(\frac{4}{N-2}+\sigma\right) x} e^{\sigma \xi_{1}}|\phi(x)|+\sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1}|\phi(x)|, \tag{3.5}
\end{equation*}
$$

and

$$
\|h\|_{* *}=\sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1}|h(x)|
$$

The choice of norm here is motivated by the presence of 2 regimes in the solution of the linearized problem. Near the concentration points $\xi_{j}$ we have a right hand side of the form $|h(x)| \leq C e^{-\sigma\left|x-\xi_{j}\right|}$ and near these points the dominant terms in the linear operator $\mathcal{L}_{\varepsilon}$ are

$$
-\phi^{\prime \prime}+\phi-\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) e^{\varepsilon x} V^{p^{*}+\varepsilon-1} \phi
$$

so we can expect the solution $\phi$ to be controlled by $|\phi(x)| \leq C e^{-\sigma\left|x-\xi_{j}\right|}$. For $x \leq 0$ the dominant part of the linear operator is

$$
\left(\frac{2}{N-2}\right)^{2} e^{-\frac{4}{N-2} x} \phi
$$

Since the right hand side is controlled by $e^{-\sigma\left|x-\xi_{1}\right|}$, we can control $\phi$ using as supersolution $e^{\left(\frac{4}{N-2}+\sigma\right) x} e^{-\sigma \xi_{1}}$. Actually this will be a super solution for the whole linear operator for $x \leq-M$, where $M$ is defined in (3.4).

The main result in this section is solvability of problem (3.2).
Proposition 3.1. There exist positive numbers $\varepsilon_{0}$, and $C>0$ such that if the points $0<\xi_{1}<\xi_{2}<\cdots<\xi_{k}$ satisfy (2.10), then for all $0<\varepsilon<\varepsilon_{0}$ and all functions $h \in C(\mathbb{R} ; \mathbb{R})$ with $\|h\|_{* *}<+\infty$, problem (3.2) has a unique solution $\phi=: T_{\varepsilon}(h)$ with $\|\phi\|_{*}<+\infty$. Moreover,

$$
\begin{equation*}
\|\phi\|_{*} \leq C\|h\|_{* *} \quad \text { and } \quad\left|c_{j}\right| \leq C\|h\|_{* *} \tag{3.6}
\end{equation*}
$$

We first consider a simpler problem

$$
\left\{\begin{array}{l}
\mathcal{L}_{0}(\phi)-\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) e^{\varepsilon x} V^{p^{*}+\varepsilon-1} \phi=h+\sum_{j=1}^{k} c_{j} Z_{j} \text { in }(-\infty,+\infty)  \tag{3.7}\\
\lim _{|x| \rightarrow \infty} \phi(x)=0 \\
\int_{\mathbb{R}} Z_{j} \phi=0, \quad \forall j=1, \cdots, k
\end{array}\right.
$$

for certain constants $c_{j}$, here $\mathcal{L}_{0}$ is defined by (1.8).
Lemma 3.2. Under the assumptions of Proposition 3.1, then for all $0<\varepsilon<\varepsilon_{0}$ and any $h, \phi$ solution of (3.7), we have

$$
\begin{equation*}
\|\phi\|_{*} \leq C\|h\|_{* *}, \tag{3.8}
\end{equation*}
$$

and

$$
\begin{equation*}
\left|c_{j}\right| \leq C\|h\|_{* *} . \tag{3.9}
\end{equation*}
$$

Proof. To prove (3.8), by contradiction, we suppose that there exist sequences $\phi_{n}$, $h_{n}, \varepsilon_{n}$ and $c_{j}^{n}$ that satisfy (3.7), with

$$
\left\|\phi_{n}\right\|_{*}=1, \quad\left\|h_{n}\right\|_{* *} \rightarrow 0, \quad \varepsilon_{n} \rightarrow 0
$$

We get a contradiction by the following steps.
Step 1: $c_{j}^{n} \rightarrow 0$ as $n \rightarrow+\infty$.
Multiplying (3.7) by $Z_{i}^{n}$ and integrating by parts twice, we get that

$$
\begin{align*}
& \sum_{j=1}^{k} c_{j}^{n} \int_{\mathbb{R}} Z_{j}^{n} Z_{i}^{n} \\
= & -\int_{\mathbb{R}} h_{n} Z_{i}^{n}+\int_{\mathbb{R}}\left[\mathcal{L}_{0}\left(Z_{i}^{n}\right)-\alpha_{\varepsilon_{n}}\left(p^{*}+\varepsilon_{n}\right) e^{\varepsilon_{n} x} V^{p^{*}+\varepsilon_{n}-1} Z_{i}^{n}\right] \phi_{n} \tag{3.10}
\end{align*}
$$

Note that

$$
\int_{\mathbb{R}} Z_{j}^{n} Z_{i}^{n}=C \delta_{i j}+o(1)
$$

where $\delta_{i j}$ is Kronecker's delta. Then (3.10) defines a linear system in the $c_{j}^{\prime}$ s which is almost diagonal as $n \rightarrow \infty$.

Since $Z_{i}^{n}(x)=\partial_{\xi_{i}^{n}} V_{\xi_{i}^{n}}(x)=O\left(e^{-\left|x-\xi_{i}^{n}\right|}\right)$, we then have

$$
\begin{align*}
\left|\int_{\mathbb{R}} h_{n} Z_{i}^{n}\right| & \leq C\left\|h_{n}\right\|_{* *} \int_{\mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}^{n}\right|}\right) e^{-\left|x-\xi_{i}^{n}\right|} d x \\
& \leq C k\left\|h_{n}\right\|_{* *} \int_{\mathbb{R}} e^{-|y|} d y \leq C\left\|h_{n}\right\|_{* *} \tag{3.11}
\end{align*}
$$

Moreover, $Z_{i}^{n}$ satisfy

$$
\mathcal{L}_{0}\left(Z_{i}^{n}\right)=p^{*} W^{p^{*}-1}\left(x-\xi_{i}^{n}\right) \partial_{\xi_{i}^{n}} W\left(x-\xi_{i}^{n}\right)
$$

so we get

$$
\begin{equation*}
\left|\int_{\mathbb{R}}\left[\mathcal{L}_{0}\left(Z_{i}^{n}\right)-\alpha_{\varepsilon_{n}}\left(p^{*}+\varepsilon_{n}\right) e^{\varepsilon_{n} x} V^{p^{*}+\varepsilon_{n}-1} Z_{i}^{n}\right] \phi_{n}\right|=o(1)\left\|\phi_{n}\right\|_{*} \tag{3.12}
\end{equation*}
$$

From (3.10)-(3.12), we obtain

$$
\begin{equation*}
\left|c_{j}^{n}\right| \leq C\left\|h_{n}\right\|_{* *}+o(1)\left\|\phi_{n}\right\|_{* *} \tag{3.13}
\end{equation*}
$$

Thus $\lim _{n \rightarrow \infty} c_{j}^{n}=0$.
Step 2: For any $L>0$, any $l \in\{1,2, \cdots, k\}$, we have

$$
\begin{equation*}
\sup _{x \in\left[\xi_{l}^{n}-L, \xi_{l}^{n}+L\right]}\left|\phi_{n}(x)\right| \rightarrow 0, \quad \text { as } n \rightarrow \infty \tag{3.14}
\end{equation*}
$$

Indeed, suppose not, we assume that there exist $L>0$ and some $l \in\{1,2, \cdots, k\}$ such that

$$
\left|\phi_{n}\left(x_{n, l}\right)\right| \geq c>0, \quad \text { for some } x_{n, l} \in\left[\xi_{l}^{n}-L, \xi_{l}^{n}+L\right]
$$

By elliptic estimates, there is a subsequence of $\phi_{n}$ converging uniformly on compact sets to a nontrivial bounded solution $\tilde{\phi}$ of

$$
\mathcal{L}_{0}(\tilde{\phi})=p^{*} W^{p^{*}-1}\left(x-\xi_{l}\right) \tilde{\phi}
$$

where $\xi_{l}=\lim _{n \rightarrow \infty} \xi_{l}^{n}$. By nondegeneracy [27], it is well known that $\tilde{\phi}=c Z_{l}$ for some constant $c \neq 0$. But taking the limit in the orthogonality condition $\int_{\mathbb{R}} Z_{l}^{n} \phi_{n}=0$, we obtain $\tilde{\phi}=0$, which is a contradiction. Thus (3.14) holds.

Step 3: We prove that $\left\|\phi_{n}\right\|_{*} \rightarrow 0$ as $n \rightarrow \infty$.
Claim: For any $L>0$ and $j \in\{1,2, \cdots, k\}$, we have

$$
\begin{equation*}
\sup _{\mathbb{R} \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}^{n}\right|}\right)^{-1}\left|\phi_{n}(x)\right| \rightarrow 0 \tag{3.15}
\end{equation*}
$$

and

$$
\begin{equation*}
\sup _{x \leq-M} e^{-\left(\frac{4}{N-2}+\sigma\right) x} e^{\sigma \xi_{1}^{n}}\left|\phi_{n}(x)\right| \rightarrow 0 \tag{3.16}
\end{equation*}
$$

as $n \rightarrow+\infty$.
By the definition of $\|\cdot\|_{*}$ in (3.5), using (3.14), (3.15) and (3.16), we get that $\left\|\phi_{n}\right\|_{*} \rightarrow 0$ as $n \rightarrow \infty$.

Now we prove the above claim. We note that

$$
h_{n}+\sum_{j=1}^{k} c_{j}^{n} Z_{j}^{n} \leq\left(C_{0}\left\|h_{n}\right\|_{* *}+o\left(\left\|\phi_{n}\right\|_{*}\right)\right) \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}^{n}\right|}, \quad \text { with } \quad C_{0}>0
$$

For $x \in \mathbb{R} \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]$, let us define

$$
\begin{aligned}
\tilde{\psi}_{n}(x)= & \left(C_{0}\left\|h_{n}\right\|_{* *}+e^{\sigma L} \sup _{\cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]}\left|\phi_{n}(x)\right|+o\left(\left\|\phi_{n}\right\|_{*}\right)\right) \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}^{n}\right|} \\
& +\varrho \sum_{j=1}^{k} e^{-\bar{\sigma}\left|x-\xi_{j}^{n}\right|}
\end{aligned}
$$

with $\varrho>0$ small but fixed and $0<\bar{\sigma}<\sigma$. Then by choosing suitable large $L>0$, we get

$$
\begin{aligned}
& \mathcal{L}_{0}\left(\tilde{\psi}_{n}(x)\right)-\alpha_{\varepsilon_{n}}\left(p^{*}+\varepsilon_{n}\right) e^{\varepsilon_{n} x} V^{p^{*}+\varepsilon_{n}-1} \tilde{\psi}_{n}(x) \\
\geq & \mathcal{L}_{0}\left(\phi_{n}(x)\right)-\alpha_{\varepsilon_{n}}\left(p^{*}+\varepsilon_{n}\right) e^{\varepsilon_{n} x} V^{p^{*}+\varepsilon_{n}-1} \phi_{n}(x)
\end{aligned}
$$

On the other hand, we have that for any $L>0$ and $j \in\{1,2, \cdots, k\}$,

$$
\tilde{\psi}_{n}\left(\xi_{j}^{n}-L\right) \geq \phi_{n}\left(\xi_{j}^{n}-L\right) \quad \text { and } \quad \tilde{\psi}_{n}\left(\xi_{j}^{n}+L\right) \geq \phi_{n}\left(\xi_{j}^{n}+L\right)
$$

Moreover, there exists $R>0$ large enough, such that

$$
\tilde{\psi}_{n}(R) \geq \phi_{n}(R)
$$

and

$$
\tilde{\psi}_{n}(-R) \geq \phi_{n}(-R)
$$

By the maximum principle, we get

$$
\phi_{n}(x) \leq \tilde{\psi}_{n}(x) \quad \text { for } x \in[-R, R] \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]
$$

Similarly, we obtain $\phi_{n}(x) \geq-\tilde{\psi}_{n}(x)$ for $x \in[-R, R] \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]$. Thus

$$
\left|\phi_{n}(x)\right| \leq \tilde{\psi}_{n}(x) \quad \text { for } \quad x \in[-R, R] \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]
$$

Letting $R \rightarrow+\infty$, we get

$$
\left|\phi_{n}(x)\right| \leq \tilde{\psi}_{n}(x) \quad \text { for } \quad x \in \mathbb{R} \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]
$$

Letting $\varrho \rightarrow 0$, for $x \in \mathbb{R} \backslash \cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]$, we have that
$\left|\phi_{n}(x)\right| \leq\left(C_{0}\left\|h_{n}\right\|_{* *}+e^{\sigma L} \sup _{\cup_{j=1}^{k}\left[\xi_{j}^{n}-L, \xi_{j}^{n}+L\right]}\left|\phi_{n}(x)\right|+o\left(\left\|\phi_{n}\right\|_{*}\right)\right) \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}^{n}\right|}$.
So (3.15) holds.
For $x \leq-M$, let $\rho>0$ small and $C_{1}>0$ be chosen later on, we define

$$
\psi_{n}(x)=C_{1}\left(C_{0}\left\|h_{n}\right\|_{* *}+o\left(\left\|\phi_{n}\right\|_{*}\right)\right) e^{\left(\frac{4}{N-2}+\sigma\right) x} e^{-\sigma \xi_{1}^{n}}+\rho e^{\frac{4}{N-2} x}
$$

By the maximum principle, we get

$$
\phi_{n}(x) \leq \psi_{n}(x) \quad \text { for } \quad x \in[-R,-M]
$$

if $R>0$ is large enough. By a similar argument, we obtain $\phi_{n}(x) \geq-\psi_{n}(x)$ for $x \in[-R,-M]$. Thus

$$
\left|\phi_{n}(x)\right| \leq \psi_{n}(x) \quad \text { for } x \in[-R,-M] .
$$

Let $R \rightarrow+\infty$, we get

$$
\left|\phi_{n}(x)\right| \leq \psi_{n}(x) \quad \text { for } \quad x \in[-\infty,-M] .
$$

Let $\rho \rightarrow 0$, we have

$$
\left|\phi_{n}(x)\right| \leq C_{1}\left(C_{0}\left\|h_{n}\right\|_{* *}+o\left(\left\|\phi_{n}\right\|_{*}\right)\right) e^{\left(\frac{4}{N-2}+\sigma\right) x} e^{-\sigma \xi_{1}^{n}} \quad \text { for } \quad x \in[-\infty,-M] .
$$

So we obtain that (3.16) holds.
Moreover, estimate (3.9) follows from (3.13) and (3.8).
Proof of Proposition 3.1. From Lemma 3.2, for $\phi$ and $h$ satisfying (3.2), we then have

$$
\|\phi\|_{*} \leq C\left(\|h\|_{* *}+\left\|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right\|_{* *}\right)
$$

and

$$
\left|c_{j}\right| \leq C\left(\|h\|_{* *}+\left\|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right\|_{* *}\right)
$$

In order to establish (3.6), it is sufficient to show that

$$
\begin{equation*}
\left\|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right\|_{* *} \leq o(1)\|\phi\|_{*} . \tag{3.17}
\end{equation*}
$$

Indeed,

$$
\begin{align*}
\left\|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right\|_{* *} \leq & \sup _{x \leq-M}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1}\left|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right| \\
& \quad+\sup _{x \geq-M}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1}\left|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right|:=Q_{1}+Q_{2} . \tag{3.18}
\end{align*}
$$

Now we estimate $Q_{1}$ and $Q_{2}$ respectively, we first have

$$
\begin{align*}
Q_{1} & \leq C \sup _{x \leq-M} e^{\sigma\left|x-\xi_{1}\right|}|\phi(x)| e^{-\left(p^{*}-q\right) x} V^{q-1} \\
& \leq C e^{-(q-1) \xi_{1}} \sup _{x \leq-M} e^{-\left(\frac{4}{N-2}+\sigma\right) x} e^{\sigma \xi_{1}}|\phi(x)| . \tag{3.19}
\end{align*}
$$

For $Q_{2}$, if $-M \leq x \leq \xi_{1}$, then we have

$$
\begin{aligned}
e^{-\left(p^{*}-q\right) x} V^{q-1} & \leq \sum_{j=1}^{k} e^{-\left(p^{*}-q\right) x} e^{-(q-1)\left|x-\xi_{j}\right|} \leq C e^{\left(2 q-p^{*}-1\right) x} e^{-(q-1) \xi_{1}} \\
& \leq C \max \left\{e^{-\left(p^{*}-q\right) \xi_{1}}, e^{-(q-1) \xi_{1}}\right\}
\end{aligned}
$$

If $x \geq \xi_{1}$, then we have

$$
e^{-\left(p^{*}-q\right) x} V^{q-1} \leq \sum_{j=1}^{k} e^{-\left(p^{*}-q\right) x} e^{-(q-1)\left|x-\xi_{j}\right|} \leq C e^{-\left(p^{*}-q\right) x} \leq C e^{-\left(p^{*}-q\right) \xi_{1}}
$$

Thus we find

$$
\begin{equation*}
Q_{2} \leq C \max \left\{e^{-\left(p^{*}-q\right) \xi_{1}}, e^{-(q-1) \xi_{1}}\right\} \sup _{x \geq-M}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1}|\phi(x)| \tag{3.20}
\end{equation*}
$$

From (3.18), (3.19) and (3.20), we get

$$
\left\|e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right\|_{* *} \leq C \max \left\{e^{-\left(p^{*}-q\right) \xi_{1}}, e^{-(q-1) \xi_{1}}\right\}\|\phi\|_{*}=o(1)\|\phi\|_{*}
$$

So estimate (3.17) holds.
We now prove the existence and uniqueness of solution to (3.2). Consider the Hilbert space

$$
H=\left\{\phi \in H^{1}(\mathbb{R}): \int_{\mathbb{R}} Z_{j} \phi=0, \quad \forall j=1,2, \cdots, k .\right\}
$$

with inner product

$$
\langle\phi, \psi\rangle=\int_{\mathbb{R}}\left(\phi^{\prime} \psi^{\prime}+\phi \psi\right) d x
$$

Then problem (3.7) is equivalent to find $\phi \in H$ such that

$$
\begin{gather*}
\langle\phi, \psi\rangle=\int_{\mathbb{R}}\left[\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) V^{p^{*}+\varepsilon-1} \phi+\lambda q \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q-1} \phi\right. \\
\left.+\left(\frac{2}{N-2}\right)^{2} e^{-\frac{4}{N-2} x} \phi+h\right] \psi d x \tag{3.21}
\end{gather*}
$$

for all $\psi \in H$. By the Riesz representation theorem, (3.21) is equivalent to solve

$$
\begin{equation*}
\phi=K(\phi)+\tilde{h} \tag{3.22}
\end{equation*}
$$

with $\tilde{h} \in H$ depending linearly on $h$ and $K: H \rightarrow H$ being a compact operator. Fredholm's alternative yields there is a unique solution to problem (3.22) for any $h$ provided that

$$
\begin{equation*}
\phi=K(\phi) \tag{3.23}
\end{equation*}
$$

has only the zero solution in $H$. (3.23) is equivalent to problem (3.2) with $h=0$. If $h=0$, estimate (3.6) implies that $\phi=0$. This ends the proof of Proposition 3.1.

Now we study the differentiability of the operator $T_{\varepsilon}$ with respect to $\xi=$ $\left(\xi_{1}, \cdots, \xi_{k}\right)$. Consider the Banach space

$$
\mathcal{C}_{*}=\left\{f \in C(\mathbb{R}):\|f\|_{* *}<\infty\right\}
$$

endowed with the $\|\cdot\|_{* *}$ norm. The following result holds.

Proposition 3.3. Under the assumptions of Proposition 3.1, the map $\xi \mapsto T_{\varepsilon}$ is of class $C^{1}$. Moreover,

$$
\left\|D_{\xi} T_{\varepsilon}(h)\right\|_{*} \leq C\|h\|_{* *}
$$

uniformly on the vectors $\xi$ which satisfy (2.10).
Proof. Fix $h \in \mathcal{C}_{*}$ and let $\phi=T_{\varepsilon}(h)$ for $\varepsilon<\varepsilon_{0}$. Let us recall that $\phi$ satisfies

$$
\left\{\begin{array}{l}
\mathcal{L}_{\varepsilon}(\phi)=h+\sum_{j=1}^{k} c_{j} Z_{j} \quad \text { in }(-\infty,+\infty) \\
\lim _{|x| \rightarrow \infty} \phi(x)=0 \\
|x| \\
\int_{\mathbb{R}} Z_{j} \phi=0, \quad \forall j=1, \cdots, k
\end{array}\right.
$$

for certain constants $c_{j}$. Differentiating above equation with respect to $\xi_{l}, l \in$ $\{1, \cdots, k\}$. Set $Y=\partial_{\xi_{l}} \phi$ and $d_{j}=\partial_{\xi_{l}} c_{j}$, we have

$$
\begin{cases}\mathcal{L}_{\varepsilon}(Y)=\bar{h}+\sum_{j=1}^{k} d_{j} Z_{j} & \text { in }(-\infty,+\infty) \\ \lim _{|x| \rightarrow \infty} Y(x)=0 ; & \\ \mid \int_{\mathbb{R}} Y Z_{j}+\phi \partial_{\xi_{l}} Z_{j}=0, \quad \forall j=1, \cdots, k\end{cases}
$$

where
$\bar{h}=\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right)\left(p^{*}+\varepsilon-1\right) e^{\varepsilon x} V^{p^{*}+\varepsilon-2} Z_{l} \phi+\lambda q(q-1) \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q-2} Z_{l} \phi+c_{l} \partial_{\xi_{l}} Z_{l}$.
Let $\eta=Y-\sum_{i=1}^{k} b_{i} Z_{i}$, where $b_{i} \in \mathbb{R}$ is chosen such that

$$
\int_{\mathbb{R}} \eta Z_{j}=0
$$

that is,

$$
\begin{equation*}
\sum_{i=1}^{k} b_{i} \int_{\mathbb{R}} Z_{i} Z_{j}=\int_{\mathbb{R}} Y Z_{j}=\int_{\mathbb{R}} \partial_{\xi_{l}} \phi Z_{j}=-\int_{\mathbb{R}} \phi \partial_{\xi_{l}} Z_{j} \tag{3.24}
\end{equation*}
$$

This is an almost diagonal system, it has a unique solution and we have

$$
\begin{equation*}
\left|b_{i}\right| \leq C\|\phi\|_{*} . \tag{3.25}
\end{equation*}
$$

Moreover, $\eta$ satisfies

$$
\left\{\begin{array}{l}
\mathcal{L}_{\varepsilon}(\eta)=g+\sum_{j=1}^{k} d_{j} Z_{j} \quad \text { in }(-\infty,+\infty)  \tag{3.26}\\
\lim _{|x| \rightarrow \infty} \eta(x)=0 \\
\int_{\mathbb{R}} \eta Z_{j}=0, \quad \forall j=1, \cdots, k
\end{array}\right.
$$

with

$$
g=\bar{h}-\sum_{i=1}^{k} b_{i} \mathcal{L}_{\varepsilon}\left(Z_{i}\right)
$$

From Proposition 3.1, there is a unique solution $\eta=T_{\varepsilon}(g)$ to (3.26) and

$$
\begin{equation*}
\|\eta\|_{*} \leq C\|g\|_{* *} \tag{3.27}
\end{equation*}
$$

Moreover, we have

$$
\begin{align*}
\|g\|_{* *} \leq & C\left\|e^{\varepsilon x} V^{p^{*}+\varepsilon-2} Z_{l} \phi\right\|_{* *}+C\left\|e^{-\left(p^{*}-q\right) x} V^{q-2} Z_{l} \phi\right\|_{* *} \\
& +\left\|c_{l} \partial_{\xi_{l}} Z_{l}\right\|_{* *}+\sum_{i=1}^{k}\left|b_{i}\right|\left\|\mathcal{L}_{\varepsilon}\left(Z_{i}\right)\right\|_{* *} \\
& \leq C\left(\|\phi\|_{*}+\left|c_{l}\right|+\left|b_{i}\right|\right) \leq C\|h\|_{* *} \tag{3.28}
\end{align*}
$$

because $\left|b_{i}\right| \leq C\|\phi\|_{*},\|\phi\|_{*} \leq C\|h\|_{* *}$ and $\left|c_{l}\right| \leq C\|h\|_{* *}$.
By (3.25), (3.27), (3.28) and $\left\|Z_{i}\right\|_{*} \leq C$, we obtain that

$$
\left\|\partial_{\xi_{l}} \phi\right\|_{*} \leq\|\eta\|_{*}+\sum_{i=1}^{k}\left|b_{i}\right|\left\|Z_{i}\right\|_{*} \leq C\|h\|_{* *}
$$

Besides $\partial_{\xi_{l}} \phi$ depends continuously on $\xi$ in the considered region for this norm.

## 4. Nonlinear Problem

In this section, our purpose is to study nonlinear problem. We first have the validity of the following result.

Lemma 4.1. We have

$$
\begin{equation*}
\|N(\phi)\|_{* *} \leq C\left(\|\phi\|_{*}^{\min \left\{p^{*}, 2\right\}}+\|\phi\|_{*}^{\min \{q, 2\}}\right) \tag{4.1}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\|\partial_{\phi} N(\phi)\right\|_{* *} \leq C\left(\|\phi\|_{*}^{\min \left\{p^{*}-1,1\right\}}+\|\phi\|_{*}^{\min \{q-1,1\}}\right) \tag{4.2}
\end{equation*}
$$

for $\|\phi\|_{*} \leq 1$.
Proof. By the fundamental theorem of calculus and the definition of $\left\|\|_{* *}\right.$, we have

$$
\begin{aligned}
& \|N(\phi)\|_{* *} \\
\leq & \alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) \sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1} e^{\varepsilon x}\left|\int_{0}^{1}\left[(V+t \phi)^{p^{*}+\varepsilon-1}-V^{p^{*}+\varepsilon-1}\right] \phi d t\right| \\
& +\lambda q \beta_{N} \sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1} e^{-\left(p^{*}-q\right) x}\left|\int_{0}^{1}\left[(V+t \phi)^{q-1}-V^{q-1}\right] \phi d t\right| \\
:= & N_{1}+N_{2} .
\end{aligned}
$$

Using

$$
\left||a+b|^{q}-|a|^{q}\right| \leq C \begin{cases}|a|^{q-1}|b|+|b|^{q} & \text { if } q \geq 1 \\ \min \left\{|a|^{q-1}|b|,|b|^{q}\right\} & \text { if } 0<q<1\end{cases}
$$

if $p^{*} \geq 2$ and for $\|\phi\|_{*} \leq 1$, we have

$$
\begin{aligned}
N_{1} & \leq C \sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1} e^{\varepsilon x} V^{p^{*}+\varepsilon-2}|\phi|^{2}+C \sup _{x \in \mathbb{R}}\left(\sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}\right)^{-1} e^{\varepsilon x}|\phi|^{p^{*}+\varepsilon} \\
& \leq C\|\phi\|_{*}^{2}+C\|\phi\|_{*}^{p^{*}+\varepsilon} \leq C\|\phi\|_{*}^{2} .
\end{aligned}
$$

Similarly, if $1<p^{*}<2$, we find that $N_{1} \leq C\|\phi\|_{*}^{p^{*}}$. Thus we get

$$
N_{1} \leq C\|\phi\|_{*}^{\min \left\{p^{*}, 2\right\}}
$$

Moreover, by similar computations as $N_{1}$, we can conclude that

$$
N_{2} \leq C\|\phi\|_{*}^{\min \{q, 2\}}
$$

Thus we get (4.1).
We differentiate $N(\phi)$ with respect to $\phi$, we have
$\partial_{\phi} N(\phi)=\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) e^{\varepsilon x}\left[(V+\phi)^{p^{*}+\varepsilon-1}-V^{p^{*}+\varepsilon-1}\right]+\lambda \beta_{N} q e^{-\left(p^{*}-q\right) x}\left[(V+\phi)^{q-1}-V^{q-1}\right]$.
By a similar argument as $\|N(\phi)\|_{* *}$, (4.2) holds.
Lemma 4.2. Let $\sigma>0$ satisfy (3.3) and $0<\xi_{1}<\xi_{2}<\cdots<\xi_{k}$ satisfy (2.10). If $q$ satisfies (1.4), then there exist $\tau \in\left(\frac{1}{2}, 1\right)$ and a constant $C>0$, such that

$$
\|E\|_{* *} \leq C \varepsilon^{\tau}, \quad\left\|\partial_{\xi} E\right\|_{* *} \leq C \varepsilon^{\tau}
$$

Proof. We have

$$
\begin{align*}
E= & \alpha_{\varepsilon} e^{\varepsilon x}\left(V^{p^{*}+\varepsilon}-V^{p^{*}}\right)+\left(\alpha_{\varepsilon} e^{\varepsilon x}-1\right) V^{p^{*}}+\left(V^{p^{*}}-\left(\sum_{j=1}^{k} W_{j}\right)^{p^{*}}\right) \\
& +\left(\left(\sum_{j=1}^{k} W_{j}\right)-\sum_{j=1}^{p^{*}} W_{j}^{p^{*}}\right)+\lambda \beta_{N} e^{-\left(p^{*}-q\right) x} V^{q} \\
3):= & E_{1}+E_{2}+E_{3}+E_{4}+E_{5} . \tag{4.3}
\end{align*}
$$

Estimate of $E_{1}$ :

$$
\left|E_{1}\right|=\left|\varepsilon \alpha_{\varepsilon} e^{\varepsilon x} \int_{0}^{1} V^{p^{*}+t \varepsilon} \log V d t\right| \leq C \varepsilon \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
$$

Estimate of $E_{2}$ : By the Taylor expansion, we have

$$
\begin{aligned}
\left|E_{2}\right| & =\left|\left(\left(\frac{p^{*}-1}{2}\right)^{-\frac{2 \varepsilon}{p^{*}-1}} e^{\varepsilon x}-1\right) V^{p^{*}}\right| \\
& =\left(\varepsilon x \int_{0}^{1} e^{t \varepsilon x} d t+O(\varepsilon) e^{\varepsilon x}\right) V^{p^{*}} \leq C \varepsilon|\log \varepsilon| \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
\end{aligned}
$$

Estimate of $E_{3}$ : Since

$$
\left|E_{3}\right|=\left|V^{p^{*}}-\left(\sum_{j=1}^{k} W_{j}\right)^{p^{*}}\right| \leq C V^{p^{*}-1} \sum_{j=1}^{k}\left|R_{\xi_{j}}(x)\right|
$$

Thanks to Lemma 2.2, for $x \leq 0$, we have

$$
\left|E_{3}\right| \leq C V^{p^{*}-1} \sum_{j=1}^{k} e^{-\left|x-\xi_{j}\right|} \leq C V^{p^{*}-1} e^{-\xi_{1}} \leq C \varepsilon^{\frac{1}{p^{*}-q}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
$$

For $0 \leq x \leq \xi_{1}$,

$$
\begin{aligned}
\left|E_{3}\right| & \leq C V^{p^{*}-1} \sum_{j=1}^{k} e^{-\left|x-\xi_{j}\right|} e^{-\frac{2}{N-2} \min \left\{x, \xi_{j}\right\}} \\
& \leq C \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|} \begin{cases}\varepsilon^{\frac{2}{N+2-(N-2) q}} & \text { if } N \geq 4 \\
\varepsilon^{\frac{1}{5-q}} & \text { if } N=3\end{cases}
\end{aligned}
$$

If $x \geq \xi_{1}$, for $0<\sigma<p^{*}-1$, we have

$$
\begin{aligned}
\left|E_{3}\right| & \leq C V^{p^{*}-1} \sum_{j=1}^{k} e^{-\left|x-\xi_{j}\right|} e^{-\frac{2}{N-2} \min \left\{x, \xi_{j}\right\}} \\
& \leq C V^{p^{*}-1} e^{-\frac{2}{N-2} \xi_{1}} \leq C \varepsilon^{\frac{2}{N+2-(N-2) q}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
\end{aligned}
$$

Therefore we get for $x \in \mathbb{R}$,

$$
\left|E_{3}\right| \leq C \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|} \begin{cases}\varepsilon^{\frac{2}{N+2-(N-2) q}} & \text { if } N \geq 4 \\ \varepsilon^{\frac{1}{5-q}} & \text { if } N=3\end{cases}
$$

Estimate of $E_{4}$ : If $-\infty<x \leq \frac{\xi_{1}+\xi_{2}}{2}$, we have

$$
\begin{aligned}
\left|E_{4}\right| & \leq\left|\left(\sum_{j=1}^{k} W\left(x-\xi_{j}\right)\right)^{p^{*}}-W\left(x-\xi_{1}\right)^{p^{*}}\right|+\left|\sum_{j=2}^{k} W\left(x-\xi_{j}\right)^{p^{*}}\right| \\
& \leq p^{*}\left(\sum_{j=1}^{k} W\left(x-\xi_{j}\right)\right)^{p^{*}-1} \sum_{j=2}^{k} W\left(x-\xi_{j}\right)+\sum_{j=2}^{k} W\left(x-\xi_{j}\right)^{p^{*}} \\
& =p^{*}\left(\sum_{j=1}^{k} W\left(x-\xi_{j}\right)\right)^{p^{*}-1-\theta}\left(\sum_{j=1}^{k} W\left(x-\xi_{j}\right)\right)^{\theta} \sum_{j=2}^{k} W\left(x-\xi_{j}\right)+\sum_{j=2}^{k} W\left(x-\xi_{j}\right)^{p^{*}}
\end{aligned}
$$

with a positive number $\theta$, satisfying $0<\theta<p^{*}-1-\sigma$. Note that

$$
\left(\sum_{j=1}^{k} W\left(x-\xi_{j}\right)\right)^{\theta} \sum_{j=2}^{k} W\left(x-\xi_{j}\right) \leq C \varepsilon^{\frac{1+\theta}{2}}
$$

Moreover,

$$
\sum_{j=2}^{k} W\left(x-\xi_{j}\right)^{p^{*}} \leq C \varepsilon^{\frac{p^{*}-\sigma}{2}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
$$

Thus

$$
\left|E_{4}\right| \leq C \varepsilon^{\frac{1+\theta}{2}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}, \quad \text { for } \quad-\infty<x \leq \frac{\xi_{1}+\xi_{2}}{2}
$$

with $0<\theta<p^{*}-1-\sigma$. Similarly, for $\frac{\xi_{l-1}+\xi_{l}}{2} \leq x \leq \frac{\xi_{l}+\xi_{l+1}}{2}$ with $l=2, \cdots, k-1$, and $x \geq \frac{\xi_{k-1}+\xi_{k}}{2}$, we get

$$
\left|E_{4}\right| \leq C \varepsilon^{\frac{1+\theta}{2}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
$$

Therefore for $x \in \mathbb{R}$, we have

$$
\left|E_{4}\right| \leq C \varepsilon^{\frac{1+\theta}{2}} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}, \quad \text { where } 0<\theta<p^{*}-1-\sigma
$$

The estimate of $E_{5}$ is similar as the previous ones and we get

$$
\left|E_{5}\right| \leq C \max \left\{\varepsilon, \varepsilon^{\frac{q-\sigma}{p^{*}-q}}\right\} \sum_{j=1}^{k} e^{-\sigma\left|x-\xi_{j}\right|}
$$

From (4.3) and the previous estimates, for $0<\theta<p^{*}-1-\sigma$ with $\sigma$ satisfying (3.3), we have

$$
\|E\|_{* *} \leq C \begin{cases}\max \left\{\varepsilon|\log \varepsilon|, \varepsilon^{\frac{2}{N+2-(N-2) q}}, \varepsilon^{\frac{1+\theta}{2}}, \varepsilon^{\frac{q-\sigma}{p^{*}-q}}\right\} & \text { if } N \geq 4 \\ \max \left\{\varepsilon|\log \varepsilon|, \varepsilon^{\frac{1}{5-q}}, \varepsilon^{\frac{1+\theta}{2}}, \varepsilon^{\frac{q-\sigma}{p^{*}-q}}\right\} & \text { if } N=3\end{cases}
$$

Therefore if $q$ satisfies (1.4), we find that there esists $\tau \in\left(\frac{1}{2}, 1\right)$ such that

$$
\|E\|_{* *} \leq C \varepsilon^{\tau}
$$

Differentiating $E$ with respect to $\xi_{i}(i=1,2, \cdots, k)$, we have

$$
\begin{aligned}
\partial_{\xi_{i}} E= & \alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) e^{\varepsilon x} V^{p^{*}+\varepsilon-1} \partial_{\xi_{i}} V-p^{*} \sum_{j=1}^{k} W\left(x-\xi_{j}\right)^{p^{*}-1} \partial_{\xi_{i}} W\left(x-\xi_{j}\right) \\
& +\lambda \beta_{N} q e^{-\left(p^{*}-q\right) x} V^{q-1} \partial_{\xi_{i}} V
\end{aligned}
$$

The proof of estimate for $\left\|\partial_{\xi} E\right\|_{* *}$ is similar to that of $\|E\|_{* *}$.
Proposition 4.3. Assume that $0<\xi_{1}<\xi_{2}<\cdots<\xi_{k}$ satisfy (2.10). Then there exists $C>0$ such that for $\varepsilon>0$ small enough, there exists a unique solution $\phi=\phi(\xi)$ to problem (3.1) with

$$
\|\phi\|_{*} \leq C \varepsilon^{\tau}
$$

for some $\tau \in\left(\frac{1}{2}, 1\right)$ satisfying Lemma 4.2. Moreover, the map $\xi \mapsto \phi(\xi)$ is of class $C^{1}$ for the $\|\cdot\|_{*}$ norm, and

$$
\left\|\partial_{\xi} \phi\right\|_{*} \leq C \varepsilon^{\tau}
$$

Proof. Problem (3.1) is equivalent to solve a fixed point problem

$$
\phi=T_{\varepsilon}(N(\phi)+E):=A_{\varepsilon}(\phi)
$$

We will show that the operator $A_{\varepsilon}$ is a contraction map in a proper region. Set

$$
\mathcal{F}_{\gamma}=\left\{\phi \in C(\mathbb{R}):\|\phi\|_{*} \leq \gamma \varepsilon^{\tau}\right\}
$$

where $\gamma>0$ will be chosen later.
For $\phi \in \mathcal{F}_{\gamma}$, by Lemmas 4.1 and 4.2, we get

$$
\left\|A_{\varepsilon}(\phi)\right\|_{*}=\left\|T_{\varepsilon}(N(\phi)+E)\right\|_{*} \leq C\|N(\phi)\|_{* *}+\|E\|_{* *}
$$

$$
\leq C\left(\gamma^{\min \left\{p^{*}, 2\right\}} \varepsilon^{\min \left\{p^{*}-1,1\right\} \tau}+\gamma^{\min \{q, 2\}} \varepsilon^{\min \{q-1,1\} \tau}+1\right) \varepsilon^{\tau}
$$

Then we have $A_{\varepsilon}(\phi) \in \mathcal{F}_{\gamma}$ for $\phi \in \mathcal{F}_{\gamma}$ by choosing $\gamma$ large enough but fixed.
Moreover, for $\phi_{1}, \phi_{2} \in \mathcal{F}_{\gamma}$, by writing

$$
N\left(\phi_{1}\right)-N\left(\phi_{2}\right)=\int_{0}^{1} N^{\prime}\left(\phi_{2}+t\left(\phi_{1}-\phi_{2}\right)\right) d t\left(\phi_{1}-\phi_{2}\right)
$$

By Proposition 3.1 and using (4.2), we find

$$
\begin{aligned}
& \left\|A_{\varepsilon}\left(\phi_{1}\right)-A_{\varepsilon}\left(\phi_{2}\right)\right\|_{*} \leq C\left\|N\left(\phi_{1}\right)-N\left(\phi_{2}\right)\right\|_{* *} \\
\leq & C\left(\left(\max _{i=1,2}\left\|\phi_{i}\right\|_{*}\right)^{\min \left\{p^{*}-1,1\right\}}+\left(\max _{i=1,2}\left\|\phi_{i}\right\|_{*}\right)^{\min \{q-1,1\}}\right)\left\|\phi_{1}-\phi_{2}\right\|_{*} \\
\leq & C \varepsilon^{\kappa}\left\|\phi_{1}-\phi_{2}\right\|_{*}
\end{aligned}
$$

with some $\kappa>0$. This implies that $A_{\varepsilon}$ is a contraction map from $\mathcal{F}_{\gamma}$ to $\mathcal{F}_{\gamma}$. Thus $A_{\varepsilon}$ has a unique fixed point in $\mathcal{F}_{\gamma}$.

Now we consider the differentiability of $\xi \mapsto \phi(\xi)$. We write

$$
B(\xi, \phi):=\phi-T_{\varepsilon}(N(\phi)+E)
$$

First we observe that $B(\xi, \phi)=0$. Moreover,

$$
\partial_{\phi} B(\xi, \phi)[\theta]=\theta-T_{\varepsilon}\left(\theta\left(\partial_{\phi}(N(\phi))\right)\right) \equiv \theta+M(\theta),
$$

where

$$
M(\theta)=-T_{\varepsilon}\left(\theta\left(\partial_{\phi}(N(\phi))\right)\right)
$$

By a direct calculation, we get

$$
\|M(\theta)\|_{*} \leq C\left\|\theta\left(\partial_{\phi}(N(\phi))\right)\right\|_{* *} \leq C \varepsilon^{\kappa}\|\theta\|_{*}
$$

So for $\varepsilon>0$ small enough, the operator $\partial_{\phi} B(\xi, \phi)$ is invertible with uniformly bounded inverse in $\|\cdot\|_{*}$. It also depends continuously on its parameters. Let us differentiate with respect to $\xi$, we have

$$
\partial_{\xi} B(\xi, \phi)=-\left(\partial_{\xi} T_{\varepsilon}\right)(N(\phi)+E)-T_{\varepsilon}\left(\left(\partial_{\xi} N\right)(\xi, \phi)+\partial_{\xi} E\right),
$$

where all these expressions depend continuously on their parameters. The implicit function theorem yields that $\phi(\xi)$ is of class $C^{1}$ and

$$
\partial_{\xi} \phi=-\left(\partial_{\phi} B(\xi, \phi)\right)^{-1}\left[\partial_{\xi} B(\xi, \phi)\right]
$$

so that

$$
\left\|\partial_{\xi} \phi\right\|_{*} \leq C\left(\|N(\phi)\|_{* *}+\|E\|_{* *}+\left\|\left(\partial_{\xi} N\right)(\xi, \phi)\right\|_{* *}+\left\|\partial_{\xi} E\right\|_{* *}\right) \leq C \varepsilon^{\tau}
$$

## 5. The finite-dimensional variational Reduction

According to the results of the previous section, our problem has been reduced to find points $\xi=\left(\xi_{1}, \xi_{2}, \cdots, \xi_{k}\right)$, such that

$$
\begin{equation*}
c_{j}(\xi)=0 \quad \text { for all } j=1, \cdots, k \tag{5.1}
\end{equation*}
$$

If (5.1) holds, then $v=V+\phi$ is a solution to (1.7), and $u=\sum_{j=1}^{k} U_{\mu_{j}}+\psi$ is the solution to problem (1.3) with $\psi=\mathcal{T}^{-1}(\phi)$.

Define the function $\mathcal{I}_{\varepsilon}:\left(\mathbb{R}^{+}\right)^{k} \rightarrow \mathbb{R}$ as

$$
\mathcal{I}_{\varepsilon}(\xi):=I_{\varepsilon}(V+\phi)
$$

where $V$ is defined by (2.11) and $I_{\varepsilon}$ is the energy functional of (1.7) defined by

$$
\begin{aligned}
I_{\varepsilon}(v)= & \frac{1}{2} \int_{-\infty}^{+\infty}\left(\left|v^{\prime}(x)\right|^{2}+|v|^{2}\right) d x+\frac{1}{2}\left(\frac{2}{N-2}\right)^{2} \int_{-\infty}^{+\infty} e^{-\frac{4}{N-2} x} v^{2} d x \\
& -\frac{1}{p^{*}+\varepsilon+1} \alpha_{\varepsilon} \int_{-\infty}^{+\infty} e^{\varepsilon x}|v|^{p^{*}+\varepsilon+1} d x-\frac{1}{q+1} \lambda \beta_{N} \int_{-\infty}^{+\infty} e^{-\left(p^{*}-q\right) x}|v|^{q+1} d x
\end{aligned}
$$

We have the following fact.
Lemma 5.1. The function $V+\phi$ is a solution to (1.7) if and only if $\xi=\left(\xi_{1}, \cdots, \xi_{k}\right)$ is a critical point of $\mathcal{I}_{\varepsilon}(\xi)$, where $\phi=\phi(\xi)$ is given by Proposition 4.3.

Proof. For $s \in\{1,2, \cdots, k\}$, we have

$$
\begin{aligned}
\partial_{\xi_{s}} \mathcal{I}_{\varepsilon}(\xi) & =\partial_{\xi_{s}}\left(I_{\varepsilon}(V+\phi)\right)=D I_{\varepsilon}(V+\phi)\left[\partial_{\xi_{s}} V+\partial_{\xi_{s}} \phi\right] \\
& =\sum_{j=1}^{k} c_{j} \int_{\mathbb{R}} Z_{j}\left[\partial_{\xi_{s}} V+\partial_{\xi_{s}} \phi\right]=\sum_{j=1}^{k} c_{j}\left(\int_{\mathbb{R}} Z_{j} Z_{s} d x+o(1)\right),
\end{aligned}
$$

where $o(1) \rightarrow 0$ as $\varepsilon \rightarrow 0$ uniformly for the norm $\|\cdot\|_{*}$. This implies that the above relations define an almost diagonal homogeneous linear equation system for the $c_{j}$. Thus $\xi$ is the critical point of $I_{\varepsilon}$ if and only if $c_{j}=0$ for all $j=1,2, \cdots, k$.

Lemma 5.2. The following expansion holds

$$
\mathcal{I}_{\varepsilon}(\xi)=I_{\varepsilon}(V)+o(\varepsilon)
$$

as $\varepsilon \rightarrow 0$, where $o(\varepsilon)$ is uniform in the $C^{1}$-sense on the vectors $\xi$ satisfying (2.10).
Proof. By the fact that $D I_{\varepsilon}(V+\phi)[\phi]=0$ and using the Taylor expansion, we have

$$
\begin{aligned}
& \mathcal{I}_{\varepsilon}(\xi)-I_{\varepsilon}(V)=I_{\varepsilon}(V+\phi)-I_{\varepsilon}(V)=\int_{0}^{1} D^{2} I_{\varepsilon}(V+t \phi)\left[\phi^{2}\right] t d t \\
= & \int_{0}^{1} t d t \int_{-\infty}^{+\infty}(N(\phi)+E) \phi d x \\
& +\left(p^{*}+\varepsilon\right) \alpha_{\varepsilon} \int_{0}^{1} t d t \int_{-\infty}^{+\infty} e^{\varepsilon x}\left[V^{p^{*}+\varepsilon-1}-(V+t \phi)^{p^{*}+\varepsilon-1}\right] \phi^{2} d x \\
& +\lambda \beta_{N} q \int_{0}^{1} t d t \int_{-\infty}^{+\infty} e^{-\left(p^{*}-q\right) x}\left[V^{q-1}-(V+t \phi)^{q-1}\right] \phi^{2} d x .
\end{aligned}
$$

Since $\|\phi\|_{*} \leq C \varepsilon^{\tau}$ and $\|E\|_{* *} \leq C \varepsilon^{\tau}$ with $\tau>\frac{1}{2}$, we get

$$
\mathcal{I}_{\varepsilon}(\xi)-I_{\varepsilon}(V)=O\left(\varepsilon^{2 \tau}\right)=o(\varepsilon)
$$

uniformly on the points $\xi$ which satisfy (2.10).
Moreover, differentiating with respect to $\xi_{s}$, we have

$$
\begin{aligned}
& \partial_{\xi_{s}}\left(\mathcal{I}_{\varepsilon}(\xi)-I_{\varepsilon}(V)\right)=\int_{0}^{1} \int_{-\infty}^{+\infty} \partial_{\xi_{s}}[(N(\phi)+E) \phi] t d x d t \\
& +\alpha_{\varepsilon}\left(p^{*}+\varepsilon\right) \int_{0}^{1} t d t \int_{-\infty}^{+\infty} e^{\varepsilon x} \partial_{\xi_{s}}\left(\left[V^{p^{*}+\varepsilon-1}-(V+t \phi)^{p^{*}+\varepsilon-1}\right] \phi^{2}\right) d x \\
& +\lambda \beta_{N} q \int_{0}^{1} t d t \int_{-\infty}^{+\infty} e^{-\left(p^{*}-q\right) x} \partial_{\xi_{s}}\left(\left[V^{q-1}-(V+t \phi)^{q-1}\right] \phi^{2}\right) d x
\end{aligned}
$$

By the fact that $\left\|\partial_{\xi} \phi\right\|_{*} \leq C \varepsilon^{\tau}$ and $\left\|\partial_{\xi} E\right\|_{* *} \leq C \varepsilon^{\tau}$ with $\tau>\frac{1}{2}$, we deduce that

$$
\partial_{\xi_{s}}\left(\mathcal{I}_{\varepsilon}(\xi)-I_{\varepsilon}(V)\right)=O\left(\varepsilon^{2 \tau}\right)=o(\varepsilon)
$$

Now we consider the energy functional of problem (1.3), which is defined by

$$
J(u)=\frac{1}{2} \int_{\mathbb{R}^{N}}\left(|\nabla u|^{2}+u^{2}\right)-\frac{1}{p^{*}+1+\varepsilon} \int_{\mathbb{R}^{N}}|u|^{p^{*}+1+\varepsilon}-\frac{\lambda}{q+1} \int_{\mathbb{R}^{N}}|u|^{q+1}
$$

By a direct calculation, we have that

$$
\begin{equation*}
I_{\varepsilon}(V)=\left(\frac{2}{N-1}\right)^{N-1} \frac{1}{\omega_{N-1}} J(U) \tag{5.2}
\end{equation*}
$$

where $V$ is defined by (2.11), $\omega_{N-1}$ is the volume of the unit sphere in $\mathbb{R}^{N}$ and $U(z)=\sum_{j=1}^{k} U_{\mu_{j}}(z)$ with $U_{\mu_{j}}$ satisfying problem (2.1).

We give the following expansion of $J(U)$, whose proof is in the Appendix.
Lemma 5.3. Assume that (2.8) and (2.9) hold, then we have the following expansion:

$$
\begin{equation*}
J(U)=a_{1}+a_{2} \varepsilon-\varphi\left(\Lambda_{1}, \cdots, \Lambda_{k}\right) \varepsilon+a_{3} \varepsilon \log \varepsilon+o(\varepsilon) \tag{5.3}
\end{equation*}
$$

where

$$
\begin{equation*}
\varphi\left(\Lambda_{1}, \cdots, \Lambda_{k}\right)=a_{4} \Lambda_{1}^{\frac{N+2-(N-2) q}{2}}-a_{5} \sum_{i=1}^{k} \log \Lambda_{i}+a_{6} \sum_{l=1}^{k-1}\left(\frac{\Lambda_{l+1}}{\Lambda_{l}}\right)^{\frac{N-2}{2}} \tag{5.4}
\end{equation*}
$$

and as $\varepsilon \rightarrow 0, o(\varepsilon)$ is uniform in the $C^{1}$-sense on the $\Lambda_{i}$ 's satisfying (2.8), and

$$
\begin{aligned}
a_{1}= & \frac{k}{N} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z, \\
a_{2}= & \frac{k}{\left(p^{*}+1\right)^{2}} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z \\
& -\frac{k}{p^{*}+1} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} \log \frac{\alpha_{N}}{\left(1+|z|^{2}\right)^{\frac{N-2}{2}}} d z, \\
a_{3}= & \frac{(N-2)^{2}}{4 N}\left(\alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z\right) \\
& \times \sum_{i=1}^{k}\left(\frac{2(i-1)}{N-2}+\frac{2}{N+2-(N-2) q}\right), \\
a_{4}= & \frac{\lambda}{q+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{(N-2)(q+1)}{2}} d z,} \\
a_{5}= & \frac{(N-2)^{2}}{4 N}\left(\alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z\right), \\
a_{6}= & \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{N+2}{2}} \frac{1}{|z|^{N-2}} d z .} .
\end{aligned}
$$

Now we are ready to prove our main result.

Proof of Theorem 1.1. Thanks to Lemma 5.1, we know that

$$
u=\sum_{j=1}^{k} U_{\mu_{j}}+\psi \quad \text { with } \psi=\mathcal{T}^{-1}(\phi)
$$

is a solution to problem (1.3) if and only if $\xi$ is a critical point of $\mathcal{I}_{\varepsilon}(\xi)$, where the existence of $\phi$ is guaranteed by Proposition 4.3.

Finding a critical point of $\mathcal{I}_{\varepsilon}(\xi)$ is equivalent to find that of $\widetilde{\mathcal{I}}_{\varepsilon}(\xi)$, which is defined as

$$
\widetilde{\mathcal{I}}_{\varepsilon}(\xi)=-\left(\frac{N-1}{2}\right)^{N-1} \frac{\omega_{N-1}}{\varepsilon} \mathcal{I}_{\varepsilon}(\xi)+\frac{a_{1}}{\varepsilon}+a_{2}+a_{3} \log \varepsilon
$$

On the other hand, from Lemmas 5.2 and 5.3, using (5.2), we have

$$
\begin{aligned}
\mathcal{I}_{\varepsilon}(\xi) & =I_{\varepsilon}(V)+o(\varepsilon)=\left(\frac{2}{N-1}\right)^{N-1} \frac{1}{\omega_{N-1}} J(U)+o(\varepsilon) \\
& =\left(\frac{2}{N-1}\right)^{N-1} \frac{1}{\omega_{N-1}}\left[a_{1}+a_{2} \varepsilon-\varphi\left(\Lambda_{1}, \cdots, \Lambda_{k}\right) \varepsilon+a_{3} \varepsilon \log \varepsilon\right]+o(\varepsilon)
\end{aligned}
$$

as $\varepsilon \rightarrow 0$, where $\varphi(\Lambda)$ is defined by (5.4) and $o(\varepsilon)$ is uniform in the $C^{1}$-sense. Then we have

$$
\begin{equation*}
\widetilde{\mathcal{I}}_{\varepsilon}(\xi)=\varphi(\Lambda)+o(1) \tag{5.5}
\end{equation*}
$$

where $o(1)$ is uniform in the $C^{1}$-sense as $\varepsilon \rightarrow 0$.
We set $s_{1}=\Lambda_{1}, s_{j}=\frac{\Lambda_{j}}{\Lambda_{j-1}}$, then we can write $\varphi\left(\Lambda_{1}, \cdots, \Lambda_{k}\right)$ as

$$
\begin{aligned}
\varphi\left(s_{1}, \cdots, s_{k}\right) & =a_{4} s_{1}^{\frac{N+2-(N-2) q}{2}}-a_{5} k \log s_{1}-\sum_{j=2}^{k}\left[a_{5}(k-j+1) \log s_{j}-a_{6} s_{j}^{\frac{N-2}{2}}\right] \\
& :=\tilde{\varphi}_{1}-\sum_{j=2}^{k} \tilde{\varphi}_{j}
\end{aligned}
$$

with

$$
\tilde{\varphi}_{1}=a_{4} s_{1}^{\frac{N+2-(N-2) q}{2}}-a_{5} k \log s_{1}
$$

and

$$
\tilde{\varphi}_{j}=a_{5}(k-j+1) \log s_{j}-a_{6} s_{j}^{\frac{N-2}{2}}, \quad j=2, \cdots, k
$$

We note that

$$
\begin{equation*}
\bar{s}_{1}=\left(\frac{2 a_{5} k}{a_{4}(N+2-(N-2) q)}\right)^{\frac{2}{N+2-(N-2) q}} \tag{5.6}
\end{equation*}
$$

is the critical point of $\tilde{\varphi}_{1}$, and

$$
\begin{equation*}
\bar{s}_{j}=\left(\frac{2 a_{5}(k-j+1)}{(N-2) a_{6}}\right)^{\frac{2}{N-2}}, \quad j=2, \cdots, k \tag{5.7}
\end{equation*}
$$

is the critical point of $\tilde{\varphi}_{j}$. Moreover

$$
\tilde{\varphi}_{1}^{\prime \prime}\left(\bar{s}_{1}\right)<0, \quad \tilde{\varphi}_{j}^{\prime \prime}\left(\bar{s}_{j}\right)<0, \quad j=2, \cdots, k
$$

So $\left(\bar{s}_{1}, \bar{s}_{2}, \cdots, \bar{s}_{k}\right)$ is a nondegenerate critical point of $\varphi\left(s_{1}, \cdots, s_{k}\right)$. Thus

$$
\Lambda^{*}:=\left(\bar{s}_{1}, \bar{s}_{2} \bar{s}_{1}, \bar{s}_{3} \bar{s}_{2} \bar{s}_{1}, \cdots, \bar{s}_{k} \times \cdots \times \bar{s}_{2} \bar{s}_{1}\right)
$$

is a nondegenerate critical point of $\varphi(\Lambda)$. It follows that the local degree $\operatorname{deg}(\nabla \varphi(\Lambda), \mathcal{O}, 0)$ is well defined and is nonzero, here $\mathcal{O}$ is an arbitrarily small neighborhood of $\Lambda^{*}$. Hence from (5.5), for $\varepsilon>0$ small enough, we have that $\operatorname{deg}\left(\nabla_{\xi} \widetilde{\mathcal{I}}_{\varepsilon}(\xi), \overline{\mathcal{O}}, 0\right) \neq 0$, where $\overline{\mathcal{O}}$ is a small neighborhood of $\xi^{*}=\left(\xi_{1}^{*}, \cdots, \xi_{k}^{*}\right)$ and

$$
\xi_{j}^{*}=\left[(j-1)+\frac{1}{p^{*}-q}\right] \log \frac{1}{\varepsilon}-\frac{N-2}{2} \log \left(\bar{s}_{j} \bar{s}_{j-1} \cdots \bar{s}_{1}\right), \text { for } \forall j=1, \cdots, k .
$$

So $\xi^{*}$ is a critical point of $\widetilde{\mathcal{I}}_{\varepsilon}(\xi)$, which implies there is a critical point of $\mathcal{I}_{\varepsilon}$.
Furthermore, if for some $i,\left|x-\xi_{i}\right| \leq C_{0}$ with some $C_{0}>0$, then we have $|\phi|=o\left(W\left(x-\xi_{i}\right)\right)$. Thus $\psi(|z|)=\mathcal{T}^{-1}(\phi(x))=o\left(w_{\mu_{i}}\right)$ for $\frac{1}{C} \mu_{i} \leq|z| \leq C \mu_{i}$. Moreover, from (c) of Lemma 2.1, we get that $R_{\mu_{i}}=o\left(w_{\mu_{i}}\right)$ for $\frac{1}{C} \mu_{i} \leq|z| \leq C \mu_{i}$. Therefore we obtain (1.5) holds with

$$
\Lambda_{j}^{*}=\bar{s}_{j} \bar{s}_{j-1} \cdots \bar{s}_{1}, \quad j=1, \cdots, k
$$

where $\bar{s}_{j}$ are given by (5.6) and (5.7). This finishes the proof.

## 6. Appendix

6.1. Proof of Lemma 2.1. In order to prove Lemma 2.1, we introduce the Green function. For a fixed $z \in \mathbb{R}^{N}$, let $G(z, y)$ be the Green function of $-\Delta+I d$, which satisfies

$$
\begin{array}{rrr}
-\Delta G(z, y)+G(z, y) & =\delta_{z}(y) \quad \text { in } \mathbb{R}^{N} \\
G(z, y) \rightarrow 0 & |y| \rightarrow \infty
\end{array}
$$

We have the following result.
Lemma 6.1. We have

$$
|G(z, y)| \leq \frac{C}{|y-z|^{N-2}} \quad \text { for } \quad 0<|y-z| \leq 1
$$

and

$$
|G(z, y)| \leq C|y-z|^{\frac{1-N}{2}} e^{-|y-z|} \quad \text { for } \quad|y-z| \geq 1
$$

Proof. By radial symmetry, we can write $G(z, y)=G(r)$ with $r=|y-z|$. Since $G(r)$ is singular at zero and tends to zero at infinity, we can verify that $G$ is given by

$$
G(r)=\frac{N-2}{(2 \pi)^{\frac{N}{2}} \Gamma\left(\frac{N}{2}\right)^{2}} r^{\frac{2-N}{2}} K_{\frac{N-2}{2}}(r)
$$

where $K_{\frac{N-2}{2}}(r)$ is a Modified Bessel Function of the Second Kind, see [15]. For $N=3$, the function $G$ has the explicit form $G(r)=\frac{e^{-r}}{4 \pi r}$. In general, we have that $K_{\frac{N-2}{2}}(r) \sim \frac{\Gamma\left(\frac{N-2}{2}\right)}{2}\left(\frac{2}{r}\right)^{\frac{N-2}{2}}$ for $r$ close to 0 , and $K_{\frac{N-2}{2}}(r) \sim \sqrt{\frac{\pi}{2 r}} e^{-r}$ for $r$ large. Using these estimates, we obtain the result.

Proof of Lemma 2.1. (a) It is a direct consequence of the maximum principle.
(b) Define the barrier function $Q(z)=\mu^{\frac{N-2}{2}}|z|^{-(N+2)}$. It satisfies $-\Delta Q(z)+$ $Q(z) \geq c \mu^{\frac{N-2}{2}}|z|^{-(N+2)}$ for all $|z| \geq R$ with $R>0$ a large constant, here $c$ is positive constant. Since $Q(z)=\mu^{\frac{N-2}{2}} R^{-(N+2)}$ for $|z|=R$ and $U_{\mu}(z) \leq w_{\mu}(z) \leq$ $\alpha_{N} \mu^{\frac{N-2}{2}}|z|^{-(N-2)}$ for all $|z| \geq 0$. Set $\varphi(z)=A Q(z)-U_{\mu}(z)$ for some constant $A>0$, we then have $-\Delta \varphi(z)+\varphi(z) \geq 0$ for $|z| \geq R$, and $\varphi(z) \geq 0$ for $|z|=R$ by
choosing suitable constant $A$. By the maximum principle we get $U_{\mu}(z) \leq A Q(z)=$ $A \mu^{\frac{N-2}{2}}|z|^{-(N+2)}$ for $|z| \geq R$.
(c) Using the representation

$$
R_{\mu}(z)=\int_{\mathbb{R}^{N}} G(y-z) w_{\mu}(y) d y
$$

and standard convolution estimates we can obtain the stated bounds for $R_{\mu}$.
Set

$$
\widetilde{Z}_{\mu}(z)=\partial_{\mu} U_{\mu}(z), \quad \bar{Z}_{\mu}(z)=\partial_{\mu} w_{\mu}(z)
$$

then $\tilde{Z}_{\mu}(z)$ satisfies

$$
\left\{\begin{array}{l}
-\Delta \widetilde{Z}_{\mu}+\widetilde{Z}_{\mu}=\frac{N+2}{N-2} w_{\mu}^{\frac{4}{N^{-2}}} \bar{Z}_{\mu} \quad \text { in } \mathbb{R}^{N} \\
\widetilde{Z}_{\mu}(z) \rightarrow 0 \text { as } \quad|z| \rightarrow \infty
\end{array}\right.
$$

We can write

$$
\widetilde{Z}_{\mu}(z)=\bar{Z}_{\mu}(z)+\partial_{\mu} R_{\mu}(z)
$$

then $\partial_{\mu} R_{\mu}(z)$ satisfies

$$
\left\{\begin{array}{l}
-\Delta\left(\partial_{\mu} R_{\mu}(z)\right)+\partial_{\mu} R_{\mu}(z)=-\partial_{\mu} w_{\mu}(z) \quad \text { in } \mathbb{R}^{N} \\
\partial_{\mu} R_{\mu}(z) \rightarrow 0 \text { as }|z| \rightarrow \infty
\end{array}\right.
$$

We observe that $\left|-\partial_{\mu} w_{\mu}(z)\right| \leq C \mu^{-1} w_{\mu}$, then we have
Corollary 6.2. One has

$$
\begin{equation*}
\left|\partial_{\mu} R_{\mu}(z)\right| \leq C \mu^{-1}\left|R_{\mu}(z)\right| \quad \text { for } \forall z \in \mathbb{R}^{N} \tag{6.1}
\end{equation*}
$$

Moreover, by the maximum principle, we have that

$$
\begin{equation*}
\left|\widetilde{Z}_{\mu}(z)\right| \leq C \mu^{\frac{N-4}{2}}|z|^{-(N+2)} \quad \text { for } \quad|z| \geq R \tag{6.2}
\end{equation*}
$$

where $R$ is a large positive number but fixed in Lemma 2.1.

### 6.2. Expansion of energy.

Proof of Lemma 5.3. The proof is very similar to the one in [20]. The difference is that we have more terms in the energy and the initial approximation is also somewhat different. We have

$$
\begin{aligned}
J(U)= & {\left[\frac{1}{2} \int_{\mathbb{R}^{N}}\left(|\nabla U|^{2}+U^{2}\right)-\frac{1}{p^{*}+1} \int_{\mathbb{R}^{N}} U^{p^{*}+1}\right] } \\
& +\left[\frac{1}{p^{*}+1} \int_{\mathbb{R}^{N}} U^{p^{*}+1}-\frac{1}{p^{*}+1+\varepsilon} \int_{\mathbb{R}^{N}} U^{p^{*}+1+\varepsilon}\right]-\frac{\lambda}{q+1} \int_{\mathbb{R}^{N}} U^{q+1} \\
(6.3):= & J_{1}+J_{2}+J_{3} \\
\text { where } U= & \sum_{j=1}^{k} U_{\mu_{j}} \text { with } U_{\mu_{j}}=w_{\mu_{j}}+R_{\mu_{j}}
\end{aligned}
$$

As in [20] but using the estimates of $R_{\mu}$ in Lemma 2.1 we can get

$$
\begin{align*}
J_{1}= & \frac{k}{N} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z \\
& -\varepsilon \sum_{l=1}^{k-1}\left(\frac{\Lambda_{l+1}}{\Lambda_{l}}\right)^{\frac{N-2}{2}} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{N+2}{2}}} \frac{1}{|z|^{N-2}} d z+o(\varepsilon) \tag{6.4}
\end{align*}
$$

Also as in [20] we obtain

$$
\begin{align*}
J_{2}= & \varepsilon \frac{k}{\left(p^{*}+1\right)^{2}} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z \\
& -\varepsilon \frac{k}{p^{*}+1} \alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} \log \frac{\alpha_{N}}{\left(1+|z|^{2}\right)^{\frac{N-2}{2}}} d z \\
& +\varepsilon \frac{(N-2)^{2}}{4 N}\left(\alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z\right) \sum_{i=1}^{k} \log \Lambda_{i} \\
& +\frac{(N-2)^{2}}{4 N}\left(\alpha_{N}^{p^{*}+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{N}} d z\right) \\
& \quad \times \sum_{i=1}^{k}\left(\frac{2(i-1)}{N-2}+\frac{2}{N+2-(N-2) q}\right) \varepsilon \log \varepsilon+o(\varepsilon) \tag{6.5}
\end{align*}
$$

We will do with detail the estimate of the term $J_{3}$.
Given $\delta>0$ small but fixed. Let $\mu_{1}, \cdots, \mu_{k}$ be given by (2.9), set $\mu_{0}=\frac{\delta^{2}}{\mu_{1}}$ and $\mu_{k+1}=0$. Define the following annulus

$$
A_{i}:=B\left(0, \sqrt{\mu_{i} \mu_{i-1}}\right) \backslash B\left(0, \sqrt{\mu_{i} \mu_{i+1}}\right), \quad \text { for } \quad i=1, \cdots, k
$$

We observe that $B(0, \delta)=\bigcup_{i=1}^{k} A_{i}$. On each $A_{i}$, the leading term in $\sum_{j=1}^{k} U_{\mu_{j}}$ is $U_{\mu_{i}}$.
Then we have

$$
\begin{aligned}
-(q+1) J_{3}= & \lambda \sum_{l=1}^{k} \int_{A_{l}}\left[\left(U_{\mu_{l}}+\sum_{j=1, j \neq l}^{k} U_{\mu_{j}}\right)^{q+1}-U_{\mu_{l}}^{q+1}-(q+1) U_{\mu_{l}}^{q} \sum_{j=1, j \neq l}^{k} U_{\mu_{j}}\right] \\
& +\lambda \sum_{l=1}^{k} \int_{A_{l}} U_{\mu_{l}}^{q+1}+\lambda(q+1) \sum_{l=1}^{k} \int_{A_{l}} \sum_{j=1, j \neq l}^{k} U_{\mu_{l}}^{q} U_{\mu_{j}}+\lambda \int_{\mathbb{R}^{N} \backslash B(0, \delta)}\left(\sum_{j=1}^{k} U_{\mu_{j}}\right)^{q+1} \\
:= & J_{3,1}+J_{3,2}+J_{3,3}+J_{3,4}
\end{aligned}
$$

By the mean value theorem, for some $t \in[0,1]$, we have

$$
\begin{aligned}
J_{3,1} & =\lambda \frac{q(q+1)}{2} \sum_{l=1}^{k} \int_{A_{l}}\left(U_{\mu_{l}}+t \sum_{j=1, j \neq l}^{k} U_{\mu_{j}}\right)^{q-1}\left(\sum_{j=1, j \neq l}^{k} U_{\mu_{j}}\right)^{2} \\
& \leq C \lambda \sum_{j, l=1, j \neq l}^{k} \int_{A_{l}} w_{\mu_{l}}^{q-1} w_{\mu_{j}}^{2}+C \lambda \sum_{i, j, l=1, i, j \neq l}^{k} \int_{A_{l}} w_{\mu_{i}}^{q-1} w_{\mu_{j}}^{2}
\end{aligned}
$$

Since

$$
\begin{align*}
\sum_{j, l=1, j \neq l}^{k} \int_{A_{l}} w_{\mu_{l}}^{q-1} w_{\mu_{j}}^{2} & =\sum_{j, l=1, j \neq l}^{k} \int_{A_{l}}\left(w_{\mu_{l}}^{q-1} w_{\mu_{j}}^{\frac{q-1}{q}}\right) w_{\mu_{j}}^{\frac{q+1}{q}} \\
& \leq \sum_{j, l=1, j \neq l}^{k}\left(\int_{A_{l}} w_{\mu_{l}}^{q} w_{\mu_{j}}\right)^{\frac{q-1}{q}}\left(\int_{A_{l}} w_{\mu_{j}}^{q+1}\right)^{\frac{1}{q}} \tag{6.6}
\end{align*}
$$

and

$$
\begin{equation*}
\sum_{i, j, l=1, i, j \neq l}^{k} \int_{A_{l}} w_{\mu_{i}}^{q-1} w_{\mu_{j}}^{2} \leq \sum_{i, j, l=1, i, j \neq l}^{k}\left(\int_{A_{l}} w_{\mu_{i}}^{q+1}\right)^{\frac{q-1}{q+1}}\left(\int_{A_{l}} w_{\mu_{j}}^{q+1}\right)^{\frac{2}{q+1}} \tag{6.7}
\end{equation*}
$$

If $j>l$, then

$$
\begin{align*}
& \int_{A_{l}} w_{\mu_{l}}^{q} w_{\mu_{j}} d z=\alpha_{N}^{q+1} \int_{\sqrt{\mu_{l} \mu_{l+1}} \leq|z| \leq \sqrt{\mu_{l} \mu_{l-1}}} \frac{\mu_{l}^{\frac{N-2}{2} q}}{\left(\mu_{l}^{2}+|z|^{2}\right)^{\frac{N-2}{2} q}} \frac{\mu_{j}^{\frac{N-2}{2}}}{\left(\mu_{j}^{2}+|z|^{2}\right)^{\frac{N-2}{2}}} d z \\
= & \left(\frac{\mu_{j}}{\mu_{l}}\right)^{\frac{N-2}{2}} \mu_{l}^{-\frac{N-2}{2} q+\frac{N+2}{2}}\left[\alpha_{N}^{q+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{N-2}{2} q}} \frac{1}{|z|^{N-2}} d z+o(1)\right] . \tag{6.8}
\end{align*}
$$

If $j<l$, then

$$
\begin{align*}
& \int_{A_{l}} w_{\mu_{l}}^{q} w_{\mu_{j}} d x=\alpha_{N}^{q+1} \int_{\sqrt{\mu_{l} \mu_{l+1}} \leq|z| \leq \sqrt{\mu_{l} \mu_{l-1}}} \frac{\mu_{l}^{\frac{N-2}{2} q}}{\left(\mu_{l}^{2}+|z|^{2}\right)^{\frac{N-2}{2} q}} \frac{\mu_{j}^{\frac{N-2}{2}}}{\left(\mu_{j}^{2}+|z|^{2}\right)^{\frac{N-2}{2}}} d z \\
= & \left(\frac{\mu_{l}}{\mu_{j}}\right)^{\frac{N-2}{2}} \mu_{l}^{-\frac{N-2}{2} q+\frac{N+2}{2}} \alpha_{N}^{q+1} \int_{\sqrt{\frac{\mu_{l+1}}{\mu_{l}}} \leq|z| \leq \sqrt{\frac{\mu_{l-1}}{\mu_{l}}}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{N-2}{2} q}} \frac{1}{\left(1+\left(\frac{\mu_{l}}{\mu_{j}}\right)^{2}|z|^{2}\right)^{\frac{N-2}{2}}} d z \\
\leq & \left(\frac{\mu_{l}}{\mu_{j}}\right)^{\frac{N-2}{2}} \mu_{l}^{-\frac{N-2}{2} q+\frac{N+2}{2}} \alpha_{N}^{q+1} \int_{\sqrt{\frac{\mu_{l+1}}{\mu_{l}}} \leq|z| \leq \sqrt{\frac{\mu_{l-1}}{\mu_{l}}}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{N-2}{2} q}} d z . \tag{6.9}
\end{align*}
$$

For $i \neq l$, we have
(6.10) $\int_{A_{l}} w_{\mu_{i}}^{q+1} \leq C \mu_{i}^{-\frac{N-2}{2} q+\frac{N+2}{2}} \begin{cases}\left(\frac{\mu_{l}}{\mu_{i}}\right)^{\frac{N}{2}} & \text { if } i \leq l-1<l ; \\ \left(\frac{\mu_{i}^{2}}{\mu_{l} \mu_{l-1}}\right)^{\frac{N-2}{2} q-1} & \text { if } i \geq l+1>l .\end{cases}$

From (6.6)-(6.10), (1.4) and (2.9), we get $J_{3,1}=o(\varepsilon)$.
Moreover,

$$
\begin{aligned}
J_{3,2} & =\lambda \sum_{l=1}^{k} \int_{A_{l}} w_{\mu_{l}}^{q+1}+\lambda \sum_{l=1}^{k} \int_{A_{l}}\left(U_{\mu_{l}}^{q+1}-w_{\mu_{l}}^{q+1}\right) \\
& =\varepsilon \Lambda_{1}^{\frac{N+2-(N-2) q}{2}} \lambda \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{(N-2)(q+1)}{2}}} d z+o(\varepsilon) .
\end{aligned}
$$

From (6.8) and (6.9), we have

$$
J_{3,3} \leq C \lambda \sum_{l=1}^{k} \int_{A_{l}} \sum_{j=1, j \neq l}^{k} U_{\mu_{l}}^{q} U_{\mu_{j}} \leq C \lambda \sum_{l=1}^{k} \int_{A_{l}} \sum_{j=1, j \neq l}^{k} w_{\mu_{l}}^{q} w_{\mu_{j}}=o(\varepsilon)
$$

Finally,

$$
J_{3,4}=\lambda \int_{\mathbb{R}^{N} \backslash B(0, \delta)}\left(\sum_{j=1}^{k} U_{\mu_{j}}\right)^{q+1} \leq C \sum_{j=1}^{k} \int_{\mathbb{R}^{N} \backslash B(0, \delta)} w_{\mu_{j}}^{q+1} d z=o(\varepsilon)
$$

Thus we get

$$
\begin{equation*}
J_{3}=-\varepsilon \Lambda_{1}^{\frac{N+2-(N-2) q}{2}} \frac{\lambda}{q+1} \int_{\mathbb{R}^{N}} \frac{1}{\left(1+|z|^{2}\right)^{\frac{(N-2)(q+1)}{2}}} d z+o(\varepsilon) . \tag{6.11}
\end{equation*}
$$

From (6.3), (6.4), (6.5) and (6.11), we obtain (5.3).
